Attention: Mr T Nahra

RE: Lot 106 DP755923 Inyadda Dr, Manyana NSW
Report on Geotechnical Investigation

Dear Tony,

Please find enclosed our geotechnical investigation report in relation to the acid sulphate soil assessments conducted on the above Site. This report should be read in conjunction with the attached document 'About Your Report' in Appendix A. The results of these assessments are documented herein and indicate the following:

- The Site has a very low potential for acid sulfate soil (ASS) to be present on the eastern part of the Site which is not proposed for development and will be used for environmental conservation;
- The Site proposed for residential development is underlain, in parts, by alluvial soils. ASS mapping, the elevation of these alluvial soils, and laboratory testing indicates these alluvial soils are not comprised of ASS;
- The Site, in parts, is underlain by residual soils derived from acid rock of the Wandrawandian Siltstone. The residual soils are classed as acidic soils which contain sulfur but not in the form of pyrite or Reducible Inorganic Sulfur (RIS). Their potential acidity and retained acidity are below the limits of detection. Consequently, these soils are unlikely to produce acidic conditions by oxidation alone without some additional form of chemical oxidising re-agent.
- No formal acid sulfate soil management plan is deemed required for the Site.
- The residual soils are endemic to the area and therefore can be reused on Site as general fill. However, the acidic soils do contain sulfuric ores and therefore do not met the definition of virgin excavated material (VENM). Consequently, they cannot be reused off-Site and must be treated with lime at a rate of 10kg/t prior to disposal to landfill.

Should you have any questions please contact the undersigned.

For and on behalf of Terra Insight

1 Introduction

At the request of HEIR ASQUITH (the client), Terra Insight Pty Ltd (Terra) has carried out an acid sulphate soil (ASS) assessment of Lot 106 DP755923 Inyadda Dr, Manyana NSW, hereafter referred to as the Site. It is understood that the Site is proposed for residential sub-division. Drawings showing the proposed residential development are provided in Appendix B. The objective of the geotechnical ASS investigation was to determine whether acid sulphate soils are present on the Site and if present, their net acidity and liming rate and the requirement for an Acid Management Plan (if applicable). This assessment was done in conjunction with a Preliminary (Contamination) Site Investigation which included limited sampling of the near-surface soils (< 0.5m depth). The findings of the PSI have been reported separately (refer TERRA22-165 Rep 1 Rev2).

2 Scope of work

The scope of work for this assessment included the following:

- A review of geological maps and aerial photography covering the Site;
- A review of acid sulphate mapping covering the Site;
- A visit to the Site to make observations of site surface conditions by a Geotechnical Engineer;
- A subsurface investigation comprising:
  - Twenty-four (24) boreholes (named BH1 to BH24) to 1.0m depth or shallow refusal in weathered material.
  - Sampling of the subsurface soils at 0.5m intervals for acid sulfate soil testing; and
  - Logging of the materials encountered by a geotechnical engineer;
- Laboratory testing including ASS field screen testing of all samples collected from the Site and an ASS Chromium suite test on a representative sample of the material encountered on the Site; and
- Provision of report providing the findings of the ASS assessment and recommendations in accordance with the objectives outlined above.

3 Investigation Findings

3.1 Site details and Topography

Lot 106 DP755923 Inyadda Dr, Manyana NSW, is located approximately 2.4km north east of Cunjurong Point. The Site has a surficial area of approximately 76ha with around 14ha proposed for residential development as shown on Figure 1. This development is focused mainly on the western and middle parts of the Site. The eastern part of the Site and area adjacent to existing creeks have been set aside for riparian and conservation areas.

The Site is bounded by Inyadda Drive on the western boundary and underdeveloped land on all other boundaries. Two small drainage depression cross the Site from the north-eastern corner (Creek 1) and south-western corner (Creek 2) of the Site. These flow eastwards, joining together within the eastern part of the Site (into Creek 3) and then flow into a small lake which overflows onto Inyadda Beach.

The Site has elevations varying from 5m on the eastern boundary of the Site adjacent to the creek, increasing to approximately 30m AHD on the western boundary of the Site between the two drainage depressions. Typically, the surface elevations of the areas proposed for development on the western and middle part of the Site are above 8m AHD.

3.2 Geology

The 1:250,000 geology sheet for Ulladulla indicates the Site is underlain by 'Undifferentiated Tertiary' aged sediments, consisting of gravel, sand, clay, quartzite, sandstone and conglomerate. It also shows 'Quaternary' aged alluvial sediments located around Creek 2, and around the small lake and Creek 3 located within the middle and eastern parts of the Site respectively (refer Figure 1). The area of alluvial soils around the lake and Creek 3 is remote from the areas proposed for residential development. The area of alluvial soils located within the middle of the Site and Creek 2, are located between the two portions of the Site proposed for residential development as shown on Figure 1. No alluvial sediments are mapped in association with Creek 1.

The NSW geology mobile app shows the entire Site is underlain by Cainozoic era (deposited 0 to 65 million years ago) alluvial sediments with Permian aged Snapper Point Formation and Wandrawandian Siltstone of the Shoalhaven group located to the west and north of the Site respectively (refer Figure 2).

3.3 Historical Aerial Imagery

Historical aerial photography of the Site (refer Figure 3) indicates that the Site has remained relatively unchanged since 2004. The Site is undeveloped. The creeks within the Site are visible as shallow drainage depression with adjacent low-lying areas.

Within the middle of the Site are two areas partly cleared of vegetation hereafter referred to as Area 1 and Area 2. Several dirt tracks are visible within and around these areas. Area 1 is located just to the north of Creek 2 and the alluvial sediments mapped within the middle of the Site as shown on Figure 1. Area 2 is located just to the west of the Creek 3 and the lake and the alluvial sediments mapped on the eastern part of the Site.

Area 1 has an elevation ranging from 17 to 24m AHD and Area 2 has an elevation ranging from 7 to 14m AHD with the elevations falling to the south east.

3.4 ASS risk mapping

Acid sulfate soils (ASS) are naturally occurring soils and sediments containing iron sulfides, most commonly pyrite. When pyrite in ASS is exposed to air, the iron sulfides in the soil react with oxygen and water to produce a variety of iron compounds and sulfuric acid.

Although some ASS were formed millions of years ago and occur in ancient marine rocks, those of most concern which can produce acid runoff, were formed after the last major sea level rise (within the Holocene era - ie in the past 10,000 years) and are referred to as acid sulfate soils.

ASS commonly occur in coastal wetlands as layers of marine muds and sands which are deposited in protected, low-energy environments such as barrier estuaries and coastal lakes. In similar environments, they are still being formed. Although typically encountered at elevations below 5m AHD, they can be encountered at elevations up to about 20m AHD associated with historical flooding events and former seashores.

Mapping of potential areas of ASS are documented within three potential on-line resources; viz, the NSW EPA E- Spade website, the Department of Land and Water 1:50,000 scale maps and on the online mapping services within Shoalhaven City Council.

The Shoalhaven online mapping resources show the entire Site is mapped as Class 5 ASS. Class 5 ASS means the Site is located within 500m of known areas of ASS. This means there is a very low risk of ASS being present on the Site or that there is the potential for proposed works on the Site to impact on nearby ASS if these works are not managed appropriately.

The acid sulphate soil risk map accessed online via eSPADE v2.0 (see Figure 4) and the Department of Land and Water Conservation map, which covers the Milton-Cunjurong Point area, indicates the portions of the Site proposed for residential development are not within areas with known occurrence of ASS except for the following:

- Area 2 is within proximity of a potential area of ASS occurrence. This potential area of ASS borders the eastern part of the area and is associated with Creek 3 and the lake to the east of Area 2. The ASS is mapped as Ep1. This is defined as an estuarine plain with ASS at elevations between 1 and 2 m AHD.

3.5 Site Observations

Observations of the Site were made at the time of the site inspection. Photographs taken of the general Site conditions are provided in Appendix C. The inspection of the Site was constrained to those part of the Site that were accessible by foot or car. This included, in particular, Area 1 and Area 2. The observations made within each area were as follows:

Area 1

- The area is predominantly flat with a slight fall to the south east with an RL of between 24 to 17m AHD. The surface of the Site is undulated with dirt roads and washouts within them,
- The surface of the area is scattered with foreign material including but not limited to glass bottles, building waste, rubbish, plastic, old fridges, paint containers, bricks, car bodies, and more,
- In the middle of Area 1, the Site it is predominantly grassed and surrounded by thick bush. There are several dirt vehicle tracks in and around the grassed area,

Area 2

- Area 2 has is slightly sloping south eastward with an approximate RL of 14 to 8m AHD,
- Like Area 1, Area 2 is predominantly grassed in the middle and has a few car bodies scatted throughout the open area,
- There is a dirt vehicle track around the perimeter of the grassed central part of the Area. This dirt road continues northwards towards the adjacent lot to the north of the Site,
- The vegetation on the eastern side of the area was a lot denser than the bush encountered in Area 1, especially along the drainage depression on the site.
- Along the eastern part of the Site a shallow depression as observed, which was inferred to be the creek. No water was observed flowing in the creek.

3.6 Subsurface conditions

The Site's geology mapping indicates the potential for alluvial soils along the southern part of Area 1 and along the eastern part of area 2. The ASS mapping indicates ASS is most likely to be found in the alluvial soils along the eastern part of Area 2 with no known occurrence of ASS along Creek 2.

Consequently, the investigation focused on testing for ASS along the southern and eastern parts of Area 1 and 2 respectively, which were accessible. This included testing within the two cleared areas (Area 1 and Area 2) and from adjacent nearby tracks.

The subsurface investigation was undertaken on the 5th of August and comprised the auguring of twenty-four test sites (named BH01 to BH24) to a depth of 1.0m below the existing ground surface level or refusal in weathered material where shallower.

Test locations BH01 to BH012 were located within and around Area 2 whilst test locations BH13 to BH24 were located within and around Area 1. The location of each test site within and around Area 1 and Area 2 are shown on Figure 5 and 6 respectively. The subsurface conditions encountered in the boreholes are summarised on Table 3.1 and 3.2 respectively. Engineering logs are provided in Appendix D. A groundwater table was not encountered during the investigation.

3.7 Laboratory Analysis

Acid sulfate soils (ASS) are grouped into two types, viz:

- **Actual (Active) Acid Sulfate Soils (AASS)** where the soils are oxidising, and acid is already being produced. These soils are typically identified because the pH of the soil when mixed with water is low (e.g. pHf < 4);
- **Potential (Passive) Acid Sulfate Soils (PASS)** where there is the potential for acid to be generated but the soil is not yet exposed to oxidizing conditions. In this case, a low pH is produced when the soil is mixed with an oxidizing solution resulting in a low pH (e.g. pH_{fox} < 3). Other indicators of PASS soils are a notable reaction when the oxidizing solution is applied and a pH_{fox} at least one unit lower than pH_f.

A summary of the results of acid sulfate soils field screening tests undertaken on samples of soil retrieved from each of the test sites as summarised in **Table 3-3** on the following page and provided in Appendix F.

The ASS field screening indicated the following:

- Almost all samples showed a drop in pH greater than 1 with a moderate reaction during the testing. This is indicative of a weak acidic reaction which can be associated with organic (humic) material within near surface topsoils.
- There was a variance in the Field Screen test results between samples taken from Area 1 and Area 2 as follows:
  - Western Part of the Site (Area 1): the pH_f ranged from 4.5 to 8.7 but was typically above 4 which is not indicative of the presence of AASS. The pH_{fox} was typically just above 4 which is an inconclusive result for PASS. The exceptions to this were BH13, BH20 to BH22, and BH24 where the pH_{fox} was below 4. This is considered a borderline result for the potential presence of PASS.
  - Eastern Part of the Site (Area 2), the pH_f was typically above 6 which is not indicative of the presence of AASS. The pH_{fox} was typically just above 5 which not indicative of the presence of PASS.

It is noted that samples with a borderline result for PASS, were located on the south-western part of Area 1, close to Creek 2. The lowest pH_{fox} result in this area was 3.6, found in both samples BH13 S2 (1.0m) and BH21 S1 (0.5m). Both these samples had a moderate reaction and ΔpH greater than 1 and were logged as comprised of residual soil with refusal on weathered material occurring within 1m depth. The soils were also observed to be located at relatively high elevation (>21m AHD) and west of any known mapped areas with the potential areas for ASS occurrence.

Further chromium suite testing was undertaken on a sample of soil taken from BH20 at 0.5m to assess the cause of acid generation. This result is documented in Table 3.5 and indicates the following:

- Ph KCl 4.1
- Actual acidity 0.2 % S
- Potential acidity <0.005 % S pyrite
- Retained acidity <0.02 % S pyrite
- Net acidity 0.21 %S
- Limiting rate 10 kg CaCO3/t

Given the elevation of the Site, the shallow depth to rock across the Site, and the level of acidity being below limits of reporting for potential and retained acidity, the acidity detected in the field screen results for the south-western part of Area 1 is deemed to be associated with residual soils derived from an underlying acidic rock. It is known that Wandrawandian Siltstone is located to the north of the Site and this rock formation is known to contain some acidic rock. It is expected that the soils on higher parts of the Site are associated with weathered materials associated with this rock formation.

	S2 1.0	7.9	7.7	4	0.2	✗	✗	✗	✓	NA

Notes to table: *A) This indicator is not used on its own as soils with high organic content can contain humic acid or manganese oxides which also produce a reaction;*

B) As the ΔpH increases, there is an increased probability that PASS is present.

C) The lower the pHfox the greater the potential for PASS to be present. Where pHfox < 3 and there is a strong reaction and high ΔpH, there is a high probability that PASS is present. Where the pHfox < 4 the result is less positive and further laboratory testing is required to determine the source of acid generation. Where pHfox < 5 the test is inconclusive, sulfides may be present either in small quantities or may be poorly reactive under quick field test conditions or the sample may contain carbonate which neutralises some or all acid production by oxidation. Equally the low value may be due to weak organic acids and there may be no sulfides present. Further testing to identify the cause of acid generation is recommended.

D) Samples which meet all the QASSIT indicators for PASS are assigned a high potential. Samples which meet some of the indicators for PASS are assigned a moderate potential. Samples which show an inconclusive result are assigned a low potential. It is noted that it is possible for some 'non-ASS soils' to generate acid and have all or some of the indicators of ASS. Further testing is required to assess the nature of acid generation.

Table 3-4: Summary of Chromium Suite laboratory test results

Test Location	Soil Type	Depth (m)	pH KCL	Actual Acidity [A] % S-TAA	Potential Acidity (% Sr)	Retained Acidity [C] (% S-S_{nas})	- Acid Neutralising Capacity ANCB (% S)[B]	Net Acidity (%S)	Fineness Factor	Liming Rate excluding ANC (kg/t)

BH20 S1	Clayey Silt	0.5	4.1	0.2	<0.005	<0.02	NA	0.21	1.5	10

Notes to table: LOR – level of reporting. NA – not applicable. A) only required where pH_{kci} is < 5.5, B) only required where pH_{kci} is >6.5 C) only required where pH_{kcl}<4

4 Engineering Assessment

4.1 Acid Sulfate Soils

The desk study identified that ASS may potentially exist in alluvial soils located to the east of the proposed areas for residential development (eg around Creek 3 and the lake) at elevations below 2m AHD. The ASS mapping indicates that these areas of ASS are likely to be comprised of sporadic and/or weak ASS which are unlikely to impact on the site unless dewatering of the site occurs to depths below 2m AHD.

The geotechnical investigations has confirmed that the areas proposed for residential development are underlain by alluvial soils in parts. These alluvial soils are underlain by residual soils which grade into weathered siltstone rock at shallow depth (typically < 1m). The results of the field investigation and the laboratory testing indicate the following:

- the alluvial soils encountered on the western and middle parts of the Site, within the areas proposed for development, are typically at elevations above 8m AHD and are not comprised of AASS or PASS. They are typically neutral to slightly alkaline. The potential for ASS to be present within the alluvial soils on the western and middle part of the Site in areas proposed for residential development is therefore assessed as very low.
- The residual soils underlying the Site, are in part, derived from an underlying acid rock associated with the Wandrawandian Siltstone. However, the acidity within these materials is not associated with pyrite (or reduced inorganic sulfur - RIS) and is unlikely to produce acidity by oxidation alone.

Naturally-occurring acidic soils, such as the residual soils which underlie the Site, are not considered an environmental hazard. They may form part of an acidophilic ecosystem whose health depends on maintaining an acidic environment. As an example, many soil materials in naturally acidic landscapes, such as acidic peatlands and coastal heaths, often have low pH values and high acidities. It has been demonstrated that the majority of the acidity associated with the acidic soil on the Site is not derived from the oxidation of RIS. Consequently, these materials should not be treated like ASS materials. Treating these soils as ASS may result in the liming of a naturally acidic ecosystems, leading to an unnaturally alkaline environment, resulting in severe ecological damage to the acidophilic organisms that rely on the acidic nature of such an ecosystem. Based on the above, a formal management plan for the Site is therefore deemed not required.

4.2 Waste Classification

The acidic soils underlying the site contain sulfidic ores and could potential generate acidity when exposed to certain oxidising chemical reagents. Consequently, the soils do not meet the definition of Virgin Excavated Natural Material (V/ENM) and must be treated prior to disposal to landfill. The laboratory testing indicates a liming rate of 10kg/t for material requiring off-Site disposal to landfill.

As the acidic soil is endemic to the area and is unlikely to be exposed to oxidising chemical agents as part of the residential development of the Site, the soil can be re-used on-Site without treatment.

Appendix A: Your Report

TERRA INSIGHT

Your Report

These notes have been prepared to help you understand the advice provided in Your Report and its limitations.

Your Report is based on what you tell us

Your Report has been developed based on the information you have provided such as the scope and size of your project. It applies only to the site investigated. If there are changes to the proposed works, then the advice provided within Your Report may need to be reviewed

Your Report is written with your needs in mind

The advice provided within Your Report is also not relevant to another purpose other than that originally specified at the time the report was issued. Please seek advice from Terra Insight before you share Your Report with another third party – except for the purpose for which the report was written.

Terra Insight assumes no responsibility and will not be liable to any other person or organisation for, or in relation to, any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in Your Report.

Your Report is based on what we observed

The advice provided within Your Report assumes that the site conditions, revealed through selective point sampling (undertaken in accordance with normal practices and standards) at a particular point in time, are indicative of the actual conditions on your site. However, the nature of the materials underlying your site is affected by natural processes and the activity of man. Under no circumstances can it be considered that these findings represent the actual state at all points. The subsurface conditions may vary significantly on the other parts of the site, particularly where no nearby sampling and testing work has been carried out.

As a result conditions on your site can change with time; they can also vary spatially. As a result, the actual conditions encountered may differ from those detailed within Your Report. Although nothing can be done to change the actual site conditions which exist, steps can be taken to gain a better understanding of the subsurface conditions underlying your site and reduce the potential for unexpected conditions to be encountered

The advice within Your Report also relies on interpretation of factual information based on judgement and opinion and has a level of uncertainty attached to it. Only Terra Insight is fully familiar with the background information needed to assess whether or not the report's recommendations are valid and whether or not changes should be considered as the project develops. If the details of your project have changed, the site conditions have changed or a significant amount of time as elapsed since our report was written, the advice provided within Your Report may need to be reviewed.

Your Report has been written by a Professional

The report has been prepared using accepted procedures and practices of the consulting profession at the time it was prepared, and the opinions, recommendations and conclusions set out in the report are made in accordance with generally accepted principles and practices of that profession.

Your Report is better when it is kept together

Your Report presents all the findings of the site assessment and should not be copied in part or altered in any way. Keeping Your Report intact reduces the potential for yourself or other design professionals to misinterpret the report.

Your Geo-Environmental Report

If Your Report is for geotechnical purposes only, it will not relate any findings, conclusions, or recommendations about the potential for hazardous materials to exist at the site unless you have specifically asked us to do so. If your report is written for Geo-Environmental purposes the following should be noted in addition to the above:

- Advancements in professional practice regarding contaminated land and changes in applicable statues and/or guidelines may affect the validity of this report. Consequently, the currency of conclusions and recommendations in Your Report should be verified if you propose to use this report more than 6 months after its date of issue;
- Your Report is based on information gained from environmental conditions (including assessment of some or all of soil, groundwater, vapour and surface water) and supplemented by reported data of the local area and professional experience. The assessment has been scoped with consideration to industry standards, regulations, guidelines and your specific requirements, which includes budget and timing;
- The characterisation of site conditions is an interpretation of information collected during assessment, in accordance with industry practice. Any interpretation in Your Report is not a complete description of all material on or in the vicinity of the site, due to the inherent variation in spatial and temporal patterns of contaminant presence and impact in the natural environment.
- We may have relied on data and other information provided by you and other qualified individuals in preparing Your Report. We have not verified the accuracy or completeness of such data or information except as otherwise stated in Your Report. For these reasons Your Report must be regarded as interpretative, in accordance with industry standards and practice, rather than being a definitive record.
- For each purpose, a tailored approach to the assessment of potential soil and groundwater contamination is required. In most cases, a key objective is to identify, and if possible quantify, risks that both recognised and potential contamination posed in the context of the agreed purpose. If the proposed use of the site changes, the assessment may no longer be valid and will need to be reviewed.

* For further information on this aspect reference should be made to "Guidelines for the Provision of Geotechnical information in Construction Contracts" published by the Institution of Engineers Australia, National headquarters, Canberra, 1987.

GENERAL NOTES

GENERAL

G1. ALL WORK TO BE CARRIED OUT IN ACCORDANCE WITH SHOALHAVEN COUNCIL DESIGN GUIDELINES AND SHOALHAVEN COUNCIL ENGINEERING CONSTRUCTION SPECIFICATIONS AND TO THE REQUIREMENTS OF THE CERTIFYING AUTHORITY.

G2. INSPECTIONS BY CERTIFYING AUTHORITY ARE REQUIRED AT THE FOLLOWING STAGES AND THE WORKS APPROVED PRIOR TO CONTINUANCE OF ANY FUTURE WORK:

(A) FOLLOWING INSTALLATION OF EROSION AND SEDIMENT CONTROL STRUCTURES/MEASURES.

(B) PRIOR TO BACKFILLING PIPELINES, SUBSOIL DRAINS AND DAMS.

(C) PRIOR TO CASTING OF PITS AND OTHER CONCRETE STRUCTURES, INCLUDING KERB AND GUTTER BUT FOLLOWING PLACEMENT OF FOOTINGS, FORMWORK, AND REINFORCEMENT.

(D) PRIOR TO PLACEMENT OF SUB BASE AND ALL SUBSEQUENT PAVEMENT LAYERS, A PROOF ROLLER TEST OF EACH PAVEMENT LAYER IS REQUIRED.

(E) FORMWORKS PRIOR TO POURING CONCRETE IN PARKING AREA FOR FOOTPATH CROSSING AND OTHER ASSOCIATED WORK.

(F) PRIOR TO BACKFILLING PUBLIC UTILITY CROSSINGS IN ROAD RESERVES.

(G) FINAL INSPECTIONS AFTER ALL WORKS ARE COMPLETED AND 'WORKS AS EXECUTED' PLANS HAVE BEEN SUBMITTED TO COUNCIL.

G3. NO TREES ARE TO BE REMOVED UNLESS APPROVAL IS GRANTED BY COUNCIL'S LANDSCAPE COMPLIANCE OFFICER OR AS AUTHORISED BY DEVELOPMENT CONSENT.

G4. MAKE SMOOTH JUNCTIONS WITH EXISTING WORKS.

G5. NO WORK IS TO BE CARRIED OUT ON COUNCIL PROPERTY OR ADJOINING PROPERTIES WITHOUT THE WRITTEN PERMISSION FROM THE OWNER/S.

G6. VEHICULAR ACCESS AND ALL UTILITIES/SERVICES ARE TO BE MAINTAINED AT ALL TIMES TO ADJOINING PROPERTIES AFFECTED BY CONSTRUCTION.

G7. ALL RUBBISH, BUILDINGS, SHEDS AND FENCES TO BE REMOVED TO SATISFACTION OF COUNCIL'S ENGINEER.

G8. COUNCIL ENGINEERS HAVE DISCRETION TO VARY, AS CONSIDERED NECESSARY, THE ENGINEERING REQUIREMENTS IN RESPECT OF A PARTICULAR SUBDIVISION OR DEVELOPMENT HAVING REGARD TO THE SITE CONTEXT.

EARTHWORKS

E1. EARTHWORKS ARE TO BE CARRIED OUT TO THE SATISFACTION OF THE COUNCIL. UNSUITABLE MATERIALS ARE TO BE REMOVED FROM ROADS AND LOTS PRIOR TO FILLING. THE CONTRACTOR IS TO ARRANGE AND MAKE AVAILABLE COMPACTION TESTING RESULTS FOR ALL AREAS THAT CONTAIN FILL IN EXCESS OF 200mm.

E2. COMPACTION OF EARTHWORKS SHALL CONTINUE UNTIL A DRY DENSITY RATIO OF 95% FOR SITE FILLING AND 100% FOR ROAD PAVEMENT SUBGRADES HAS BEEN ACHIEVED IN ACCORDANCE WITH TEST METHOD AS1289.5.3.1 OR AS.1289.5.1.1. THE CONTROL TESTING OF EARTHWORKS SHALL BE IN ACCORDANCE WITH THE GUIDELINES IN AS3798 'GUIDELINES ON EARTHWORKS FOR COMMERCIAL AND RESIDENTIAL DEVELOPMENTS'. WHERE IT IS PROPOSED TO USE TEST METHOD AS1289.5.8.1 TO DETERMINE THE FIELD DENSITY, A SAND REPLACEMENT METHOD SHALL BE USED TO CONFIRM THE RESULTS.

E3. THE SUITABLE QUALIFIED GEOTECHNICAL ENGINEER, SHALL HAVE A LEVEL 1 RESPONSIBILITY FOR ALL FILLING AS DEFINED IN APPENDIX B AS3798 'GUIDELINES ON EARTHWORKS FOR COMMERCIAL AND RESIDENTIAL DEVELOPMENTS', AND AT THE END OF THE WORKS SHALL CONFIRM THE EARTHWORKS COMPLY WITH THE REQUIREMENTS OF THE SPECIFICATION AND DRAWINGS BY WRITTEN NOTIFICATION.

E4. IN AREAS TO BE FILLED WHERE THE SLOPE OF THE NATURAL SURFACE EXCEEDS 1(V):4(H), BENCHES ARE TO BE CUT TO PREVENT SLIPPING OF THE PLACED FILL MATERIAL AS REQUIRED BY THE COUNCIL.

E5. ALL BATTERS ARE TO BE SCARIFIED TO A DEPTH OF 50mm TO ASSIST WITH ADHESION OF TOP SOIL TO BATTER FACE.

E6. PROVIDE MINIMUM 150mm AND MAXIMUM 300mm TOPSOIL ON FOOTPATHS, FILLED AREAS AND ALL OTHER AREAS DISTURBED DURING CONSTRUCTION. TOPSOILED AREAS TO BE STABILISED WITH APPROVED VEGETATION A MAXIMUM OF 14 DAYS AFTER TOPSOILING AND ARE TO BE WATERED TO ENSURE GERMINATION.

E7. THE CONTRACTOR SHALL CONTROL SEDIMENTATION, EROSION AND POLLUTION DURING CONSTRUCTION IN ACCORDANCE WITH THE REQUIREMENTS OF THE CURRENT EDITION OF 'MANAGING URBAN STORMWATER: SOILS AND CONSTRUCTION' PRODUCED BY LANDCOM.

E8. A MINIMUM 1m WIDE, CONTINUOUS STRIP OF COUCH GRASS SHALL BE PLACED BEHIND THE BACK OF ALL KERBS & OTHER CONCRETE STRUCTURES IMMEDIATELY AFTER THE COMPLETION OF THE FOOTPATH GRADING OR OTHER ELEMENTS AS APPLICABLE, AND SHALL BE MAINTAINED AND REPLACED AS REQUIRED DURING THE CONSTRUCTION MAINTENANCE PERIOD.

EGIS GENERAL

EC1. SURVEY SOURCED FROM:
-SURVEYOR: EGIS
-D.T.M.: 211029 Detail Survey 1.dwg DATED 11/10/2021
-ALL FILES ARE ON MGA56 GDA 2020 CO-ORDINATE SYSTEM

EC2. CONTRACTOR IS TO ENSURE THAT ALL WORKS ASSOCIATED WITH PROPERTY BOUNDARIES ARE TO BE SET OUT OR VERIFIED BY A REGISTERED SURVEYOR

EC3. PIPES UP TO 750Ø SHALL BE CONSTRUCTED WITH SPIGOT AND SOCKET RUBBER RING JOINTS AND BE OF FIBRE REINFORCED CONCRETE WHICH SHALL CONFORM RESPECTIVELY TO THE REQUIREMENTS OF AS 4139 AND AS 4058. WHERE FIBRE REINFORCED CONCRETE PIPES ARE TO BE USED, A PROPRIETARY COLLAR IS TO BE APPLIED OVER THE PIPE JOINTS.

EC4. PIPES GREATER THAN 750Ø ARE TO BE CONSTRUCTED FROM SULPHATE RESISTANT CEMENT.

ROADWORKS

R1. SUBGRADES AND SUB BASES ARE TO BE COMPACTED IN ACCORDANCE WITH COUNCIL'S CONSTRUCTION SPECIFICATION.

R2. SUBSOIL DRAINS TO BE PROVIDED ON BOTH SIDES OF ROADS (EXCEPT WHERE THERE IS STORMWATER DRAINAGE).

R3. 150 x 50 H.D. GALVANISED STEEL KERB OUTLETS TO BE PLACED IN ALL KERB TYPES ON LOW SIDE OF LOTS. PROVIDE SUITABLE ADAPTOR TO ALLOW CONNECTION OF 90mm DIAMETER STORMWATER PIPE.

R4. LIPLESS PERAMBULATOR CROSSINGS ARE TO BE PROVIDED IN ALL KERB RETURNS AND WHERE REQUIRED BY COUNCIL.

R5. SERVICE CONDUITS TO BE PLACED AS DIRECTED BY ALL PUBLIC UTILITY AUTHORITIES INCLUDING ENDEVOUR ENERGY, NBN AND SYDNEY WATER

R6. PROPOSED UTILITIES AND SERVICES CROSSING EXISTING ROADS SHALL BE PROVIDED FOR USING A TRENCHLESS TECHNIQUE SO AS NOT TO DAMAGE THE EXISTING SURFACE. ALL SERVICE CONDUITS UNDER ROADS MUST BE LAID TO A MINIMUM DEPTH OF 750mm.

R7. CONCRETE FOOTPATH CONSTRUCTION MAY BE BONDED WITH COUNCIL PENDING COMPLETION OF UTILITY/SERVICES AND SURROUNDING DWELLINGS.

R8. ALL TEMPORARY ROADS MUST BE TEMPORARILY SEALED WITH A SINGLE COAT FLUSH SEAL.

R9. ALL PERMANENT ROADS MUST BE SEALED WITH A SINGLE COAT FLUSH SEAL AND 50mm OF AC TO BE APPLIED IN TWO 25mm THICK LAYERS. THE FINAL AC LAYER IS TO BE AC 10 AND MAY BE BONDED WITH COUNCIL AND PLACED FOLLOWING APPROVAL FROM COUNCIL.

R10. SIGNPOSTING AND LINE MARKING SHALL CONFORM TO AS1742.2 'TRAFFIC CONTROL DEVICES FOR GENERAL USE'. RAISED RETRO-REFLECTIVE PAVEMENT MARKERS TO CONFORM TO AS1906 'RETRO-REFLECTIVE MATERIALS AND DEVICES FOR ROAD TRAFFIC CONTROL PURPOSES'. ALL APRONS AND KERB FACE ON CENTRAL ISLANDS OF ROUNDABOUTS AND ALL OTHER ISLANDS TO BE DELINEATED BY REFLECTIVE WHITE MARKING. INSTALLATION SHALL OCCUR IN ACCORDANCE WITH THE PLAN APPROVED BY THE LOCAL TRAFFIC COMMITTEE.

R11. ALL LOT AND HOUSE NUMBERS MUST BE STENCILLED ON KERB FACE.

R12. STREET SIGNS TO COUNCIL STANDARD MUST BE INSTALLED BY THE CONTRACTOR.

STORMWATER

S1. ALL PIPES TO BE SPIGOT AND SOCKET, RUBBER RING JOINTED.

S2. ALL LONGITUDINAL PIPELINES IN ROADS MUST BE LOCATED UNDER KERB AND GUTTER AND BE BACKFILLED WITH APPROVED GRANULAR MATERIAL UNLESS OTHERWISE APPROVED BY THE COUNCIL ENGINEER.

S3. DRAINAGE LINES MUST BE BACKFILLED WITH APPROVED GRANULAR MATERIAL IN TRAFFICABLE AREAS. THREE (3) METRES OF SUBSOIL DRAINAGE WRAPPED IN GEOTEXTILE STOCKING MUST BE PROVIDED TO ALL DOWNSTREAM PITS.

S4. ALL GULLY PITS TO COUNCIL'S STANDARD AND LINTELS CENTRALLY PLACED AT SAG PITS.

S5. ALL PITS MUST BE BENCHED AND STREAMLINED. PROVIDE SL72 REINFORCEMENT AND GALVANISED STEP IRONS IN ALL PITS OVER 1.2-METRES DEEP AS MEASURED FROM THE TOP OF GRATE TO THE INVERT OF THE PIT.

S6. CONCRETE IS TO HAVE MINIMUM COMPRESSIVE STRENGTH OF 32MPA AT 28-DAYS UNLESS OTHERWISE APPROVED BY THE COUNCIL ENGINEER.

S7. ALL INTER-ALLOTMENT DRAINAGE MUST HAVE A MINIMUM PIPE DIAMETER OF 150mm AND A MINIMUM GRADE OF 1% UNLESS OTHERWISE APPROVED BY THE COUNCIL ENGINEER.

S8. ALL INTER-ALLOTMENT DRAINAGE LINES MUST BE LAID CENTRALLY WITHIN DRAINAGE EASEMENTS. INSPECTION PITS MUST BE PROVIDED AT ALL CHANGES OF GRADE AND DIRECTION.

S9. INTER-ALLOTMENT DRAINAGE LINES MUST BE INSTALLED AFTER SYDNEY WATER SEWERAGE LINES HAVE BEEN INSTALLED WHERE SEWER IS PROPOSED ADJACENT TO INTER-ALLOTMENT DRAINAGE LINES.

S10. 1% AEP OVERLAND FLOW PATHS MUST BE FORMED AND SHOWN ON 'WORKS AS EXECUTED' DRAWINGS.

S11. ALL PLANS (BOTH DESIGN AND WAE) ARE TO CLEARLY DELINEATE THE EXTENT/LOCATION OF FLOOD LINES INCLUDING THE 5% AEP, 1% AEP AND PMF.

S12. ADEQUATE PROVISION IS TO BE MADE TO PREVENT SCOURING AND SEDIMENTATION FOR ALL DRAINAGE WORKS IN ACCORDANCE WITH COUNCIL'S REQUIREMENTS.

S13. PIT LINTELS ARE TO BE STENCILLED WITH APPLICABLE DISTINCTION STENCIL AVAILABLE FROM COUNCIL.

S14. CATCH DRAINS MUST BE CONSTRUCTED AS REQUIRED BY THE APPROVED PLANS OR THE PRINCIPAL CERTIFYING AUTHORITY.

S15. SOIL AND WATER MANAGEMENT PLANS ARE TO BE PREPARED FOR ALL DISTURBED SITES AND ADHERED TO AT ALL TIMES DURING THE CONSTRUCTION AND MAINTENANCE PERIODS.

DIGITAL MODELS CREATED BY EGIS UNDER THIS COMMISSION ARE CREATED FOR THE PURPOSE OF THE PREPARATION OF DRAWINGS AND ESTIMATES OF QUANTITIES. INFORMATION CONTAINED IN THE DRAWINGS TAKES PRECEDENCE OVER THE DIGITAL MODEL UPON WHICH IT WAS BASED. USE OF DIGITAL MODELS, CREATED BY EGIS, BY OTHER PARTIES TO SET OUT WORKS OR FOR OTHER REASONS IS DONE ENTIRELY AT THE RISK OF THE PARTY SO USING THE DIGITAL MODEL

1. Erosion Hazard and Sediment Basins

Site Name:	INYADDA DRIVE, MANYANA
Site Location:	MANYANA, NSW
Precinct/Stage:	-
Other Details:	DA

Site area	Sub-catchment or Name of Structure					
	B1	B2	C3			
Total catchment area (ha)	14.43	8.27	0.122			
Disturbed catchment area (ha)	9.08	5.63	0.122			

Soil analysis (enter sediment type if known, or laboratory particle

Sediment Type (C , F or D) if known:						
% sand (fraction 0.02 to 2.00 mm)	45	45	45			
% silt (fraction 0.002 to 0.02 mm)	20	20	20			
% clay (fraction finer than 0.002 mm)	35	35	35			
Dispersion percentage	30.0	30.0	30.0			
% of whole soil dispersible	13.5	13.5	13.5			
Soil Texture Group	D	D	D			

Rainfall data

Design rainfall depth (no of days)	5	5	5			
Design rainfall depth (percentile)	75	75	75			
x-day , y-percentile rainfall event (mm)	19.8	19.8	19.8			
Rainfall R-factor (if known)						
IFD: 2-year, 6-hour storm (if known)	14.7	14.7	14.7			

RUSLE Factors

Rainfall erosivity (*R*-factor)	4780	4780	4780			
Soil erodibility (*K*-factor)	0.047	0.047	0.047			
Slope length (m)	60	60	20			
Slope gradient (%)	3	6	3			
Length/gradient (*LS* -factor)	0.57	1.24	0.34			
Erosion control practice (*P*-factor)	1.3	1.3	1.3			
Ground cover (*C*-factor)	1	1	1			

Sediment Basin Design Criteria (for Type D/F basins only. Leave

Storage (soil) zone design (no of months)	2	2	2			
Cv (Volumetric runoff coefficient)	0.39	0.39	0.39			

Calculations and Type D/F Sediment Basin Volumes

Soil loss (t/ha/yr)	166	361	98			
Soil Loss Class	2	4	1			
Soil loss (m^3/ha/yr)	128	278	76			
Sediment basin storage (soil) volume (m^3)	193	260	2			
Sediment basin settling (water) volume (m^3)	1114	639	9			
Sediment basin total volume (m^3)	1307	899	11			

NB for sizing of Type C (coarse) sediment basins, see Worksheet 3 (if required).

Appendix D: Engineering logs

TERRA INSIGHT

How to interpret the engineering logs in Your Report

FIELD DECRIPTIONS OF SOILS

FIELD IDENTIFICATION PROCEDURES (Excluding particles larger than 60 mm and basing fractions on estimated mass)				USC	PRIMARY NAME
COARSE GRAINED SOILS More than 65% of materials less than 63 mm is larger than 0.075 mm	GRAVELS More than half of coarse fraction is larger than 2.36 mm	CLEAN GRAVELS (Little or no fines)	Wide range in grain size and substantial amounts of all intermediate particle sizes	GW	GRAVEL
			Predominantly one size or a range of sizes with more intermediate sizes missing.	GP	GRAVEL
		GRAVELS WITH FINES Appreciable amount of fines)	Non-plastic fines (for identification procedures see ML below)	GM	SILTY GRAVEL
			Plastic fines (for identification procedures see CL below)	GC	CLAYEY GRAVEL
	SANDS More than half of coarse fraction is smaller than 2.36 mm	CLEAN SANDS (Little or no fines)	Wide range in grain sizes and substantial amounts of all intermediate sizes	SW	SAND
			Predominantly one size or a range of sizes with some intermediate sizes missing.	SP	SAND
		SANDS WITH FINES (Appreciable amount of fines)	Non-plastic fines (for identification procedures see ML below).	SM	SILTY SAND
			Plastic fines (for identification procedures see CL below).	SC	CLAYEY SAND

FINE GRAINED SOILS More than 35% of material less than 63 mm is smaller than 0.075 mm	IDENTIFICATION PROCEDURES ON FRACTIONS <0.2 mm (Note a 75Um particle is about the smallest particle that is visible to the naked eye.)				
		DRY STRENGTH	DILATANCY	TOUGHNESS	USC	PRIMARY NAME
	SILTS & CLAYS Liquid limit less than 50	None to Low	Quick to slow	None	ML	SILT
		Medium to High	None	Medium	CL	CLAY
		Low to medium	Slow to very slow	Low	CL	ORGANIC SILT
	SILTS & CLAYS Liquid limit greater than 50	Low to medium	Slow to very slow	Low to medium	MH	SILT
		High	None	High	CH	CLAY
		Medium to High	None	Low to medium	OH	ORGANIC CLAY
HIGHLY ORGANIC	Readily identified by colour, odour, spongy feel and frequently by fibrous texture by fibrous texture.				PT	PEAT

● Low plasticity – Liquid Limit w_L less than 35%. ● Medium plasticity – w_L between 35% and 50%. ● High plasticity – w_L greater than 50%.

Particle size descriptive terms

NAME	SUBDIVISION	SIZE
Boulders Cobbles		>200 mm 63 mm to 200 mm
Gravel	coarse medium fine	20 mm to 63 mm 6 mm to 20 mm 2.36 mm to 6 mm
Sand	coarse medium fine	600 µm to 2.36 mm 200 µm to 600 µm 75 µm to 200 µm

Minor components

TERM	ASSESSMENT GUIDE	PROPORTION OF MINOR COMPONENT IN:
Trace of	Presence just detectable by feel or eye, but soil properties little or no different to general properties of primary component.	Coarse grained soils: <5% Fine grained soils: <15%
With some	Presence easily detected by feel or eye, soil properties little different to general properties of primary component.	Coarse grained soils: 5 - 12% Fine grained soils: 15 - 30%

TERRA INSIGHT

How to interpret the engineering logs in Your Report

Moisture condition

TERM	DEFINITION
Dry	Looks and feels dry. Cohesive and cemented soils are hard, friable or powdery. Uncemented granular soils run freely through hands.
Moist	Soil feels cool and darkened in colour. Cohesive soils can be moulded. Granular soils tend to cohere.
Wet	As for moist but with free water forming on hands when handled.

Soil structure

ZONING		CEMENTING	
Layers	Continuous across exposure or sample.	Weakly cemented	Easily broken up by hand in air or water.
Lenses	Discontinuous shape.	Moderately cemented	Effort is required to break up the soil by hand in air or water.
Pockets	Irregular inclusions of different material.		

Consistency of cohesive soils

TERM	UNDRAINED STRENGTH s_u (kPa)	VISUAL OBSERVATION IN FIELD
Very Soft	<12	A finger can be pushed well into the soil with little effort.
Soft	12 – 25	A finger can be pushed into the soil to about 25mm depth.
Firm	25 – 50	The soil can be indented about 5mm with the thumb, but not penetrated.
Stiff	50 – 100	The surface of the soil can be indented with the thumb, but not penetrated.
Very Stiff	100 – 200	The surface of the soil can be marked, but not indented with thumb pressure.
Hard	>200	The surface of the soil can be marked only with the thumbnail.
Friable	–	Crumbles or powders when scraped by thumbnail.

Density of granular soils

TERM	DENSITY INDEX (%)
Very loose	Less than 15
Loose	15 – 35
Medium Dense	35 – 65
Dense	65 – 85
Very Dense	Greater than 85

Geological origin

TRANSPORTED SOILS

Fill	Man made deposit. Fill may be significantly more variable between tested locations than naturally occurring soils.
Aeolian soil	Deposited by wind.
Alluvial soil	Deposited by streams and rivers.
Colluvial soil	Deposited on slopes (transported downslope by gravity).
Lacustrine soil	Deposited by lakes.
Marine soil	Deposited in ocean basins, bays, beaches and estuaries.

WEATHERED IN PLACE SOILS

Extremely weathered material	Structure and fabric of parent rock visible.
Residual soil	Structure and fabric of parent rock not visible.

How to interpret the engineering logs in Your Report

FIELD DESCRIPTIONS OF ROCK

The descriptive terms used by Terra Insight are given below. They are broadly consistent with Australian Standard AS1726-1993.

Rock Substance — In engineering terms rock substance is any naturally occurring aggregate of minerals and organic material which cannot be disintegrated or remoulded by hand in air or water. Other material is described using soil descriptive terms. Effectively homogenous material, may be isotropic or anisotropic.

Defect — Discontinuity or break in the continuity of a substance or substances.

Mass — Any body of material which is not effectively homogeneous. It can consist of two or more substances without defects, or one or more substances with one or more defects.

Classification of weathering products

Term	Abbreviation	Definition
Residual Soil	RS	Soil derived from the weatherinç rock; the mass structure and substance fabric are no longer evident; there is a large change volume but the soil has not beer significantly transported.
Extremely Weathered Material	XW	Material is weathered to such ar extent that it has soil properties, it either disintegrates or can be remoulded in water. Original roc fabric still visible.
Highly Weathered Rock	HW	Rock strength is changed by weathering. The whole of the rc substance is discoloured, usuall iron staining or bleaching to the extent that the colour of the orig rock is not recognisable. Some minerals are decomposed to cla minerals. Porosity may be increa by leaching or may be decrease due to the deposition of mineral pores.
Moderately Weathered Rock	MW	The whole of the rock substance discoloured, usually by iron stair or bleaching , to the extent that colour of the fresh rock is no lon recognisable.
Slightly Weathered Rock	SW	Rock substance affected by weathering to the extent that pa staining or partial discolouration the rock substance (usually by limonite) has taken place. The colour and texture of the fresh rc is recognisable; strength proper are essentially those of the fresh rock substance.
Fresh Rock	FR	Rock substance unaffected by weathering.

Notes on Weathering:

AS1726 suggests the term "Distinctly Weathered" (DW) to cover the range of substance weathering conditions between XW and SW. For projects where it is not practical to delineate between HW and MW or it is judged that there is no advantage in making such a distinction. DW may be used with the definition given in AS1726.

Where physical and chemical changes were caused by hot gasses and liquids associated with igneous rocks, the term "altered" may be substituted for "weathering" to give the abbreviations XA, HA, MA, SA and DA.

Rock substance strength terms

Term	Abbreviation	UCS (MPa)	Point Load Index, $I_{s(50)}$ (MPa)	Field Guide
Very Low	VL	<2	Less than 0.1	Material crumbles under firm blows with sharp end of pick; can be peeled with a knife; pieces up to 30mm thick can be broken by finger pressure.
Low	L	2 to 6	0.1 to 0.3	Easily scored with a knife; indentations 1mm to 3mm show with firm bows of a pick point; has a dull sound under hammer. Pieces of core 150mm long by 50mm diameter may be broken by hand. Sharp edges of core may be friable and break during handling.
Medium	M	6 to 20	0.3 to 1.0	Readily scored with a knife; a piece of core 150mm long by 50mm diameter can be broken by hand with difficulty.
High	H	20 to 60	1 to 3	A piece of core 150mm long by 50mm can not be broken by hand but can be broken by a pick with a single firm blow; rock rings under hammer.
Very High	VH	60 to 200	3 to 10	Hand specimen breaks after more than one blow of a pick; rock rings under hammer.
Extremely High	EH	>200	More than 10	Specimen requires many blows with geological pick to break; rock rings under hammer.

Notes on Rock Substance Strength:

In anisotropic rocks the field guide to strength applies to the strength perpendicular to the anisotropy. High strength anisotropic rocks may break readily parallel to the planar anisotropy. The term "extremely low" is not used as a rock substance strength term. While the term is used in AS1726-1993, the field guide therein makes it clear that materials in that strength range are soils in engineering terms. The unconfined compressive strength for isotropic rocks (and anisotropic rocks which fall across the planar anisotropy) is typically 10 to 25 times the point load index Is(50). The ratio may vary for different rock types. Lower strength rocks often have lower ratios than higher strength rocks.

SUBSTANCE DESCRIPTIVE TERMS:

ROCK NAME	Simple rock names are used rather than precise geological classification.
PARTICLE SIZE	Grain size terms for sandstone are:
Coarse grained	Mainly 0.6mm to 2mm
Medium grained	Mainly 0.2mm to 0.6mm
Fine grained	Mainly 0.06mm (just visible) to 0.2mm
FABRIC	Terms for layering of penetrative fabric (eg. bedding, cleavage etc.) are:
Massive	No layering or penetrative fabric.
Indistinct	Layering or fabric just visible. Little effect on properties.
Distinct	Layering or fabric is easily visible. Rock breaks more easily parallel to layering of fabric.

TERRA INSIGHT

How to interpret the engineering logs in Your Report

Common defects observed in rock

Term	Definition	Diagram	Map Symbol	Graphic Log (Note 1)
Parting	A surface or crack across which the rock has little or no tensile strength. but which is not parallel or sub parallel to layering or planar anisotropy in the rock substance. May be open or closed.			 (Note 2)
Joint	A surface or crack across which the rock has little or no tensile strength. but which is not parallel or sub parallel to layering or planar anisotropy in the rock substance. May be open or closed.			 (Note 2)
Sheared Zone (Note 3)	Zone of rock substance with roughly parallel near planar, curved or undulating boundaries cut by closely spaced joints, sheared surfaces or other defects. Some of the defects are usually curved and intersect to divide the mass into lenticular or wedge shaped blocks.			
Sheared Surface (Note 3)	A near planar, curved or undulating surface which is usually smooth, polished or slickensided.			
Crushed Seam (Note 3)	Seam with roughly parallel almost planar boundaries, composed of disoriented, usually angular fragments of the host rock substance which may be more weathered than the host rock. The seam has soil properties			
Infilled Seam	Seam of soil substance usually with distinct roughly parallel boundaries formed by the migration of soil into an open cavity or joint, infilled seams less than 1mm thick may be described as veneer or coating on joint surface.			
Extremely Weathered Seam	Seam of soil substance, often with gradational boundaries. Formad by weathering of the rock substance in place.			

Notes on Defects:

1. Usually borehole logs show the true dip of defects and face sketches and sections the apparent dip.
2. Partings and joints are not usually shown on the graphic log unless considered significant.

Sheared zones, sheared surfaces and crushed seams are faults in geological terms.

DEFECT SHAPE TERMS

Planar	The defect does not vary in orientation
Curved	The defect has a gradual change in orientation
Undulating	The defect has a wavy surface
Stepped	The defect has one or more well defined steps
Irregular	The defect has many sharp changes of orientation

Note: The assessment of defect shape is partly influenced by the scale of the observation.

ROUGHNESS TERMS

Slickensided	Grooved or striated surface, usually polished
Polished	Shiny smooth surface
Smooth	Smooth to touch. Few or no surface irregularities
Rough	Many small surface irregularities (amplitude generally less than 1mm). Feels like fine to coarse sand paper.
Very Rough	Many large surface irregularities (amplitude generally more than 1mm). Feels like, or coarser than very coarse sand paper.

COATING TERMS

Clean	No visible coating
Stained	No visible coating but surfaces are discoloured
Veneer	A visible coating of soil or mineral, too thin to measure; may be patchy
Veneer	A visible coating up to 1mm thick. Thicker soil material is usually described using appropriate defect terms (eg, infilled seam). Thicker rock strength material is usually described as a vein.

Quote number	: EN/222		
No. of samples received	: 1		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris	Senior Acid Sulfate Soil Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- ASS: EA033 (CRS Suite): ANC not required because pH KCl less than 6.5
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- EA200: N/A - Not Applicable

Descriptive Results

Sub-Matrix: **SOLID**

Method: Compound	Client sample ID - Client sampling date / time	Analytical Results
EA200: AS 4964 - 2004 Identification of Asbestos in bulk samples		
EA200: Description	X001 - 05-Aug-2019 00:00	Several pieces of cement sheeting.
EA200: Description	X002 - 05-Aug-2019 00:00	One piece of asbestos cement sheeting approximately 120x100x5mm.
EA200: Description	X003 - 05-Aug-2019 00:00	Two pieces of cement sheeting.
EA200: Description	X004 - 05-Aug-2019 00:00	Two pieces of asbestos cement sheeting approximately 70x65x5mm.
