## GLOSSARY

| Acronym/ Term                    | Definition  |
|----------------------------------|---|
| Accredited Biodiversity Assessor | Individuals accredited by the Department of Planning, Industry and Environment (DPIE) to apply the Biodiversity Assessment Method.  |
| Biodiversity credit report       | The report produced by the Credit Calculator that sets out the number and class of biodiversity credits required to offset the remaining adverse impacts on biodiversity values at a development site, or on land to be biodiversity certified. |
| Biodiversity Offsets             | Management actions that are undertaken to achieve a gain in biodiversity values on areas of land in order to compensate for losses to biodiversity from the impacts of development.   |
| Biodiversity values              | The composition, structure and function of ecosystems, including threatened species, populations and ecological communities, and their habitats.  |
| Ecosystem credit                 | The class of biodiversity credit that relates to a vegetation type and the threatened species that are reliably predicted by that vegetation type (as a habitat surrogate).   |
| Locality                         | A 1500m buffer area surrounding the Subject Land  |
| Native Vegetation                | Means any of the following types of plants native to New South Wales: (a) trees (including any sapling or shrub), (b) understorey plants, (c) groundcover (being any type of herbaceous vegetation), (d) plants occurring in a wetland.         |
| Proposal                         | The development, subdivision, activity or action proposed.  |
| SAIL entity                      | Species and ecological communities that are likely to be the subject of serious and irreversible impacts (SAILs)  |
| Species credit                   | The class of biodiversity credit that relate to threatened species that cannot be reliably predicted to use an area of land based on habitat surrogates. Species that   |

---

|                    |  |
|--------------------|--|
|                    | require species credits are listed in the Threatened Biodiversity Data Collection. |
| Subject Land       | The footprint of the proposed development.   |
| Subject Properties | 99 Tait Street Crookwell   |

---

## **EXECUTIVE SUMMARY**

Fraser Ecological has been engaged to prepare a Biodiversity Development Assessment Report (BDAR) for a residential subdivision development ('the Proposal' or 'the Project') at 99 Tait Street Crookwell located in the Upper Lachlan Shire Council LGA.

This BDAR has been prepared in accordance with the Office of Environment and Heritage (OEH) (2020) Biodiversity Assessment Method (BAM). The Biodiversity Offset Scheme (BOS) applies to the Proposal, as it would require clearing of native vegetation that is mapped on the Biodiversity Values Map (BVM). Note, this is a 'streamlined assessment', in accordance with Appendix C of the BAM ('Streamlined assessment module – Small area').

The development impact area is a highly modified area that was formerly the site an existing orchard. The vegetation within study area has been modified through the establishment of improved pasture and some amenity plantings such as windrows/hedgerows that include both exotic and native tree species.

The site is predominantly existing cleared land that is dominated by introduced exotic species that does not form part of a derived native grassland. A full list of exotic species recorded on site is provided below.

Overall, the vegetation is considered to be in poor condition with low native species diversity and high weed invasion. It has low native resilience and low ability to regenerate from the native soil seedbank.

There are 3 rows of planted trees which include the following species:

- *Eucalyptus mannifera* (Brittle Gum) - planted native species
- *Eucalyptus aggregata* (Black Gum) - planted native species
- *Eucalyptus elata* (River Peppermint) - planted native species
- *Eucalyptus scoparia* (Wallangarra White Gum) - planted native species
- *Cupressus macrocarpa* (Monterey Cypress) - planted exotic species
- *Quercus robur* (English Oak) - planted exotic species

The following introduced environmental weed species were recorded on-site:

- |                               |                                |
|-------------------------------|--------------------------------|
| - <i>Pinus radiata</i> *      | - <i>Cenchrus clandestinus</i> |
| - <i>Axonopus fissifolius</i> | - <i>Chloris gayana</i>        |
| - <i>Briza maxima</i>         | - <i>Cirsium vulgare</i>       |

- 
- |  |                                   |
|--|-----------------------------------|
| - <i>Conyza bonariensis</i>                        | - <i>Sonchus oleraceus</i>        |
| - <i>Dichelachne crinita</i>                       | - <i>Sporobolus fertilis</i>      |
| - <i>Eragrostis curvula</i> ssp.<br><i>curvula</i> | - <i>Trifolium repens</i>         |
| - <i>Erigeron sumatrensis</i>                      | - <i>Senecio madagascariensis</i> |
| - <i>Holcus lanatus</i>                            | - <i>Sporobolus fertilis</i>      |
| - <i>Hypochaeris radicata</i>                      | - <i>Holcus lanatus</i> *         |
| - <i>Modiola caroliniana</i>                       | - <i>Onopordum acanthium</i> *    |
| - <i>Paspalum dilatatum</i>                        | - <i>Taraxacum officinale</i>     |
| - <i>Paspalum urvillei</i>                         | - <i>Datura ferox</i>             |
| - <i>Phalaris aquatica</i>                         | - <i>Bromus catharticus</i>       |
| - <i>Phytolacca octandra</i>                       | - <i>Medicago arabica</i>         |
| - <i>Plantago lanceolata</i>                       | - <i>Silybum marianum</i>         |
| - <i>Rumex</i> sp                                  | - <i>Modiola caroliniana</i>      |
| - <i>Setaria gracilis</i>                          | - <i>Polygonum aviculare</i>      |
| - <i>Secale cereale</i>                            | - <i>Dactylis glomerata</i>       |
| - <i>Sida rhombifolia</i>                          | - <i>Hirschfeldia incana</i>      |
|  | - <i>Nassella trichotoma</i> *    |

\*Out of the exotic species recorded, four are listed as State Priority Weeds under the Biosecurity Act. The three State Priority Weeds are also Weeds of National Significance (WoNS). State and Regional Priority Weeds are required to be managed as detailed in the South-East Regional Strategic Weed Management Plan (NSW Local Land Services 2017) to comply with the General Biosecurity Duty that all land owners/managers and persons who deal with weeds are required to fulfil under the Biosecurity Act.

The NSW SVTM does not map any native vegetation on the subject land.

The NSW SVTM broadly identifies the locality as consisting of a plant community type (PCT) PCT 3374 - Goulburn Tableland Peppermint Grassy Forest as occurring on some of the neighbouring properties.

The planted *Eucalyptus* species occurring on-site are not consistent with the PCT classification (from the BIONET vegetation classification). **Of the species listed above only planted *Eucalyptus mannifera* (Brittle Gum), are consistent with a local vegetation community.** No native understorey species were recorded on-site.

Overall the subject vegetation occurring on-site is not consistent with a native vegetation community, despite plantings of some eucalypt species that are locally indigenous.

**However, based upon the geology/ soil landscapes and locally vegetation community occurrences we have entered/assigned the vegetation occurring on-site into the BAM calculator as PCT 3374 - Goulburn Tableland Peppermint Grassy Forest.**

---

The site does not contain derived native grasslands as defined under the Biodiversity Assessment Methodology (BAM 2020).

The following Vegetation Integrity Score (VIS) was determined:

| PCT      | Vegetation Zone            | Composition Condition Score | Structure Condition Score | Function Condition Score | Vegetation Integrity Score |
|----------|----------------------------|-----------------------------|---------------------------|--------------------------|----------------------------|
| PCT 3374 | Vegetation Zone 1 (0.47ha) | 9.4                         | 32.3                      | 48                       | 24.4                       |

To assist the consent authority, the guidance document Guidance to assist a decision-maker to determine a serious and irreversible impact includes criteria that enable the application of the four principles set out in clause 6.7 of the BC Regulation to identify the species and ecological communities that are likely to be the subject of serious and irreversible impacts. No SAI entities occur on the Subject Land.

As a precautionary measure, it has been assumed that 0.47ha PCT 3307 will require removal, despite the trees not being remnant and are planted. As result the following ecosystem credits (4) will need to be retired:

| PCT      | Vegetation Zone   | Composition Condition Score | Structure Condition Score | Function Condition Score | Vegetation Integrity Score | Number of biodiversity credits required |
|----------|-------------------|-----------------------------|---------------------------|--------------------------|----------------------------|---|
| PCT 3374 | Vegetation Zone 1 | 9.4                         | 32.3                      | 48                       | 24.4                       | 4                                       |

Twenty (20) trees along the western boundary, at the rear of proposed lots 546, 550, 549 & 548 are unaffected by this stage of the subdivision and are suitable for retention.

A Vegetation Management Plan can be provided at prior to the release of the Subdivision Certificate to address any native revegetation works requested by Council as part of their conditions of consent.

---

# I INTRODUCTION

Fraser Ecological has been engaged to provide a Biodiversity Development Assessment Report (BDAR) for the proposed subdivision development at 99 Tait Street Crookwell located in the Upper Lachlan Shire Council LGA.

Refer to Figures 1-4 for the location & aerial maps showing property boundaries.

The subject site itself is not on the NSW Department of Environment's Sensitive Biodiversity Values Map (<https://www.environment.nsw.gov.au/biodiversity/biodiversity-values-map.htm>). However, Council considers the area of planted native tree removal exceeds the BOS area clearing threshold and is trigger this requirement for this assessment.

BAM plot/ quadrat surveys were undertaken on the 6<sup>th</sup> November 2024.

## I.1 Description of the site and proposal

The Subject Land size is approximately 6.85 hectares (Figures 1-4).

The site is identified as 'Cloverleigh Fields', 99 Tait Street, Crookwell and is zoned R2 – Low Density Residential pursuant to Upper Lachlan Local Environmental Plan (ULLEP) 2010, map amendment 02. Stage 05 of the subdivision is the proposed establishment of 50 residential lots across lots 321, 322 & 430, including a 1508m<sup>2</sup> drainage reserve (proposed lot 517), 2270m<sup>2</sup> community reserve (proposed lot 501), access roads & upgrading part of McDonald Street.

One hundred & thirty-four (134) trees were identified as having potential to be impacted by the proposed development (Arboricultural Impact Assessment prepared by Concept Arbor Consulting dated 17th November 2023).

The surveys for this report were undertaken on the 6th November 2024.

The site was subject to a previous DA approval (Lots 537 – 546) for DA/75/2004 (refer to Figure 7).

---

### **I.1.1 Database Searches**

The following database searches were undertaken, in order to compile a list of threatened flora and fauna species predicted to occur in the area:

- Review of threatened fauna and flora records within a 10 km radius of the site, contained in the OEH Atlas of NSW Wildlife (NSW BioNet).
- Review of the MNES records within a 10 km radius of the site, using the Commonwealth Department of Environment and Energy (DEE), EPBC Act Protected Matters Search Tool.

### **I.1.2 Vegetation Mapping**

#### **Southeast NSW Native Vegetation Classification and Mapping (NSW OEH 2011 update)- SCIVI. VIS\_ID 2230**

Classification and descriptions of native vegetation types of southeast NSW (including the South Coast and parts of the eastern tablelands), and map of extant distribution of these veg types at 1:100 000 interpretation scale. Based on the South Coast - Illawarra Vegetation Integration (SCIVI) Project, which aimed to integrate many previous vegetation classification and mapping works to produce a single regional classification and map plus information on regional conservation status of vegetation types, to inform the South Coast and Illawarra Regional Strategies. Vegetation classification based on a compilation of ~ 8,500 full-floristic field survey sites from previous studies. Classified vegetation types referred to previous studies. Distribution of veg types was mapped by spatial interpolation (modelling) from classified sites, using a hybrid decision-tree/expert system. Final model was cut to 'extant' boundaries using a compiled coverage of aerial photograph interpretation (API) of woody and wetland vegetation boundaries. A total of 189 vegetation types were identified, and types related to Endangered Ecological Communities are highlighted.; VIS\_ID 2230.

#### **NSW State Vegetation Type Map (Department of Planning and Environment 2022)**

The State Vegetation Type Map (SVTM) is a regional-scale map of NSW Plant Community Types. This map represents the current extent of each Plant Community Type, Vegetation Class and Vegetation Formation, across all tenures in NSW. Further, a SVTM map of pre-clearing is also available separately here. This map is updated periodically as part of the Integrated BioNet Vegetation Data program to improve quality and alignment to the NSW vegetation classification hierarchy.

It is accessed via the following link:

---

<https://datasets.seed.nsw.gov.au/dataset/nsw-state-vegetation-type-map>

**We have also used GIS mapping to overlay vegetation layers on top of the subject site and proposed development impact area.**

This release represents the first state-wide vegetation coverage using the NSW vegetation classification hierarchy, including the revised eastern NSW PCT classification C1.1. The “M1” in the version release number (C1.1.M1), represents the first map release against PCT master list version C1.1

This coverage supersedes pre-release versions (v1.1 and v1.1.1) and 7 individual prior regional coverages including: Sydney Metropolitan Area Mapping, SVTM Border Rivers Gwydir – Namoi, SVTM Central West – Lachlan, SVTM Riverina – Murray, SVTM Western, SVTM Central Tablelands, and SVTM Upper Hunter.

Limitations on Use: This mapping data may be used as a guide to the occurrence and distribution of Plant Community Types, Vegetation Classes, and Vegetation Formations, before and after clearing.

Users of these maps should note the following issues which will be address in future SVTM versions:

- PCT attribution errors – corrected as better information becomes available  
Spatial errors or omissions (eg, gaps and slithers or mapping linework inaccuracies)
- Eastern NSW PCT classification topologies differ from central and western NSW classification topologies
- Some PCTs mapped as part of earlier regional coverages have since been discontinued
- Some PCTs approved in BioNet have not been mapped due to technical issues
- Spatial and data gaps and discontinuities may occur at the edges of former regional coverages.
- Pre-clearing coverage for central NSW is not currently available

Map data may be downloaded, viewed within the SEED Map Viewer, or accessed via the underlying ArcGIS REST Services or WMS for integration in GIS or business applications.

The Trees Near Me NSW app provides quick access to view the map using a mobile device or desktop. Download the app from Google Play or the App Store, or access the web site at <https://treesnearme.app>.

---

### 1.1.3 Literature Review

Information sources reviewed included, but were not necessarily limited to:

- Aerial Photograph Interpretation (API);
- Relevant guidelines, including:
  - OEH *Biodiversity Assessment Method*, 2017 No 469
  - *NSW Guide to Surveying Threatened Plants* (OEH, 2016)
  - '*Species credit*' *threatened bats and their habitats: NSW survey guide for the Biodiversity Assessment Method* (OEH, 2018)
  - *Threatened Biodiversity Survey and Assessment: Guidelines for Developments and Activities* (Department of Environment and Conservation (DEC), 2004)
- OEH Threatened Species, Populations and Ecological Communities website
- Commonwealth DEE Species, Profile and Threats Database;
- OEH Threatened Species, Populations and Ecological Communities website
- Commonwealth DEE Species, Profile and Threats Database;
- Threatened species survey and assessment guidelines: field survey methods for fauna: Amphibians (DEC 2009);
- NSW Guideline to Surveying Threatened Plants (OEH 2016b);
- Operational Manual for BioMetric 3.1. (DECCW 2011);
- Survey guidelines for Australia's threatened birds. Guidelines for detecting birds listed as threatened under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2010a);
- Survey guidelines for Australia's threatened bats. Guidelines for detecting bats listed as threatened under the Environment Protection and Biodiversity Conservation Act 1999(Commonwealth of Australia 2010b);
- Survey guidelines for Australia's threatened frogs. Guidelines for detecting frogs listed as threatened under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2010c);
- Survey guidelines for Australia's threatened mammals. Guidelines for detecting mammals listed as threatened under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2011);
- Survey guidelines for Australia's threatened orchids.

- 
- Guidelines for detecting bats listed as ‘threatened’ under the Environment Protection and Biodiversity Conservation Act 1999(Commonwealth of Australia 2013).

Relevant data and literature reviewed in preparation of this report included:

- Relevant State and Commonwealth Databases:
- DPE Biodiversity Values Map v16 (DPE 2024a)
- NSW BioNet. The website of the Atlas of NSW Wildlife (DPE 2024b)
- NSW BioNet. Threatened Biodiversity Data Collection (DPE 2024c)
- NSW BioNet. Vegetation Classification System (DPE 2024d)
- NSW Government Spatial Services: Six Maps Clip & Ship (NSW Government Spatial Services 2024)
- NSW Scientific Committee Final Determinations for:
  - Southern Highlands Shale Woodlands in the Sydney Basin Bioregion – endangered ecological community listing (NSW Scientific Committee 2011).
  - Native vegetation of southeast NSW: a revised classification and map for the coast and eastern tablelands (Tozer et al. 2010).
- Biodiversity Assessment Method Calculator Version 1.4.0.00 (DIE 2024f);
- Biodiversity Assessment Method (DPIE 2020a);
- Threatened Species Survey and Assessment: Guidelines for developments and activities. Working Draft (DEC 2004);
- Surveying threatened plants and their habitats - NSW survey guide for the Biodiversity Assessment Method (DPIE 2020b);
- ‘Species credit’ threatened bats and their habitats: NSW survey guide for the Biodiversity Assessment Method (OEH 2018a);
- Guidance to assist a decision-maker to determine a serious and irreversible impact (DPIE 2019a); and
- Biodiversity Offsets and Agreement Management System (BOAMS).

---

It was not possible to determine with certainty all the fauna that utilise habitats in the subject site. This is because of the likely seasonal occurrences of some fauna species, the occasional occurrence of vagrant species, and because some species are difficult to detect because of their timid or cryptic behaviour. Therefore, in addition to targeted fauna surveys, investigations comprised an assessment of fauna habitats present on site and an indication of their potential to support native wildlife populations and, in particular, threatened species.

Section 4.2 outlines the reasoning behind why no targeted fauna surveys were considered necessary for the proposed development. This mainly because no candidate 'species credit' species will be affected by the proposal as potential habitat is absent.

A suite of Flora Species Credit species was identified within the BAMC (DPIE 2021c) and NSW Wildlife Atlas (DPIE 2021d) as having the potential to occur within the Subject Land (Table 14).

In accordance with Section 3.3 of the Surveying threatened plants and their habitats - NSW survey guide for the Biodiversity Assessment Method (DPIE 2020h), surveys targeted the most suitable habitat within the Study Area for candidate threatened flora and fauna species, using information collected from the TBDC (DPE, 2024c), the DPIE threatened species profile website (DPE, 2022d) and knowledge other threatened species within the site's locality.

The Study Area was surveyed using systematic parallel transects. Parallel field traverses were separated by 5 to 10 m for orchids, herbs and forbs, 10 to 15 m for sub-shrubs, and 10 to 20 m for species in all other life forms (shrubs and trees).

In accordance with Section 3.3 of the Surveying threatened plants and their habitats - NSW survey guide for the Biodiversity Assessment Method (DPIE 2020h), surveys targeted the most suitable habitat within the Study Area for candidate threatened flora and fauna species, using information collected from the TBDC (DPE, 2024c), the DPIE threatened species profile website (DPE, 2024d) and knowledge other threatened species within the site's locality.

It was confirmed that none of the candidate species or their habitats were present on the Subject Land.

#### **I.1.4 Other sources and consultant reports**

A desktop survey was performed to ensure all relevant documentation is considered when preparing the plan. Documents and other information resources utilised include:

- Aerial photographs (Google Maps, NearMaps & DPI Land Information)
- NSW Land and Property Information SIX Maps Viewer (<https://maps.six.nsw.gov.au/>)

- 
- The Southeast NSW Native Vegetation Classification and Mapping (NSW OEH 2010) mapped using QGIS software overlaid with cadastral boundaries obtained from the NSW Planning Portal database collection
  - Soil Landscapes of the Sydney 1:100,000 Sheet (Chapman and Murphy 1989) using the Espade Version 2.0 managed by the NSW Office of Environment and Heritage accessed 7/9/24
  - Development Layout Plans prepared by Civil Development Solutions dated August 2024 (Appendix A)
  - Arboricultural Impact Assessment prepared by Concept Arbor Consulting dated 17th November 202

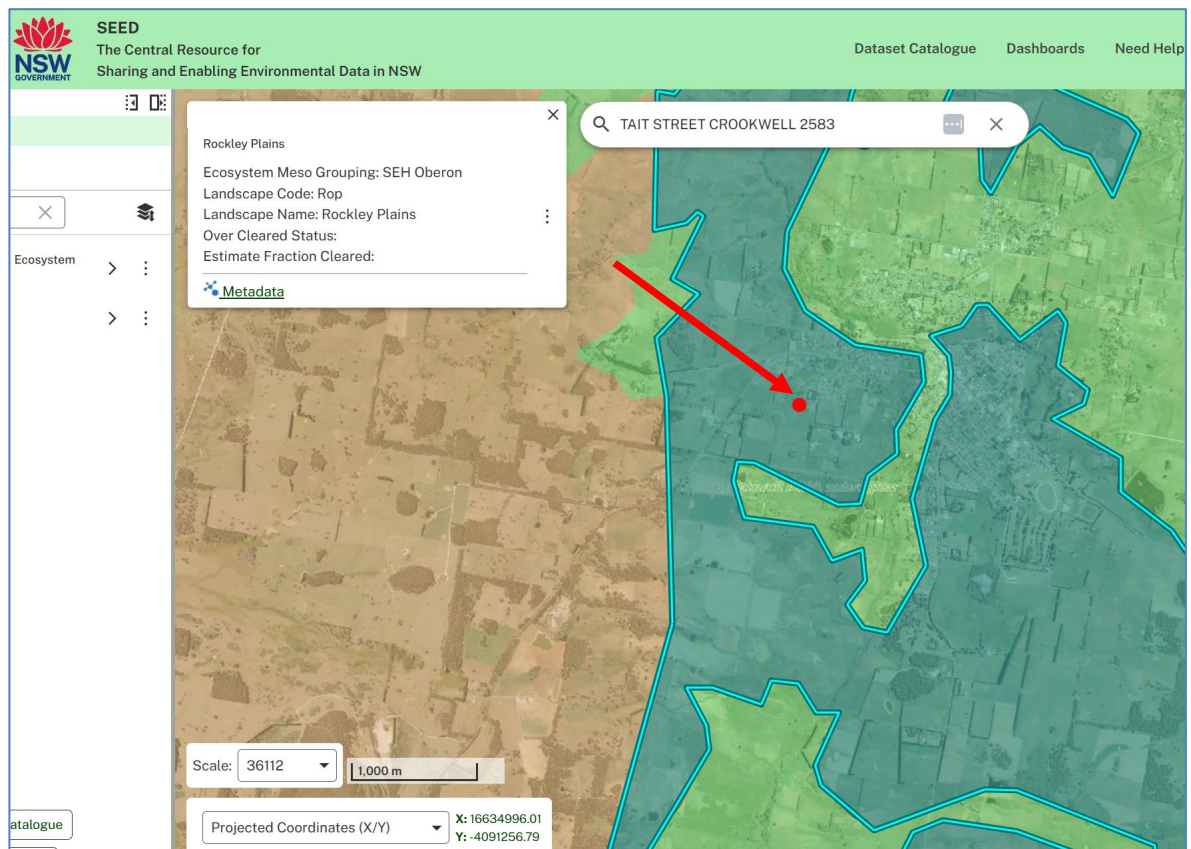

## 2 LANDSCAPE FEATURES

### 2.1 IBRA Bioregions, Subregions and Mitchell Landscapes

Dominant landscape forms have been used to divide Australia into bioregions. The site is within the **NSW South Eastern Highlands IBRA region** and the **Crookwell IBRA Subregion**.

Mitchell Landscapes are used to describe areas in NSW in a broad sense and group together areas with relatively homogenous geomorphology, soils and broad vegetation types and are mapped at a scale of 1:250000.

The subject site is within the 'Rockley Plains' Landscape (Figure 9). This landscape region has an estimated cleared fraction of 0.54 and has 'over-cleared' land status.

**Figure 9: Location of site within the 'Rockley Plains' Mitchell Landscape (red arrow)**

---

## 2.2 Native Vegetation Extent

All areas of native vegetation cover, within the site and within a 1,500 m buffer area surrounding the site, have been mapped; refer to Figure 10. It is estimated, from this mapping, that the native vegetation cover would be less than 15% provided within the BDAR manual and this was used in the BAM Offsets calculator (Section 6).

Figure 10: 1500m buffer area of the site

---

### **2.3 Wetland, Rivers, Streams and Estuaries**

No significant wetlands, rivers, streams and estuaries are present within the subject land.

### **2.4 Connectivity Features**

The biodiversity value of corridor networks is well known. Landscapes that retain more connections between patches of otherwise isolated areas of vegetation are more likely to maintain more numerous and more diverse populations of various plant and animal species (Lindenmayer and Fischer, 2006). Conversely, a lack of landscape connectivity can have a range of negative impacts on species populations (Lindenmayer and Fischer, 2006). It is thought that if existing remnants are left to persist without sufficient immigration to maintain genetic diversity, continued losses of biodiversity are certain (Parker *et al.* 2008).

The proposed development will not fragment bushland or significantly impact upon the corridor function of bushland on site as trees will be retained around the development site.

### **2.5 Areas of Geological Significance and Soil Hazard Features**

Not present.

### **2.6 Areas of Outstanding Biodiversity Value**

Under the BC Act, the Minister for the Environment may declare Areas of Outstanding Biodiversity Value (AOBV). These are special areas that contain irreplaceable biodiversity values that are considered important to NSW, Australia or globally.

No listed AOBV occur within the site or within a 1,500 m buffer around the site.

---

## **2.7 Site Context**

### **2.7.1 Patch Size**

Patch size is used to describe an area of intact native vegetation, that includes native vegetation with a gap of less than 100 m from the next area of moderate to good condition native vegetation. This gap is less than or equal to 30 m for non-woody ecosystems.

The patch size for the vegetation on-site is less than 30 hectares.

---

## 3 NATIVE VEGETATION

### 3.1 Plant Community Types

#### 3.1.1 Native plant species recorded on site

The development impact area is a highly modified area that was formerly the site an existing orchard (refer to Figure 13 that shows old aerial imagery of the site). The vegetation within study area has been modified through the establishment of improved pasture and some amenity plantings such as windrows/hedgerows that include both exotic and native tree species.

The site is predominantly existing cleared land that is dominated by introduced exotic species that does not form part of a derived native grassland. A full list of exotic species recorded on site is provided below.

Overall, the vegetation is considered to be in poor condition with low native species diversity and high weed invasion. It has low native resilience and low ability to regenerate from the native soil seedbank.

There are 3 rows of planted trees which include the following species:

- *Eucalyptus mannifera* (Brittle Gum) - planted native species
- *Eucalyptus aggregata* (Black Gum) - planted native species
- *Eucalyptus elata* (River Peppermint) - planted native species
- *Eucalyptus scoparia* (Wallangarra White Gum) - planted native species
- *Cupressus macrocarpa* (Monterey Cypress) - planted exotic species
- *Quercus robur* (English Oak) - planted exotic species

Refer to photographs provided on the following pages.

The tree numbering system is provided within the Arboricultural Impact Assessment prepared by Concept Arbor Consulting dated 17th November 2023 - refer to Section 8.1 for further details).

The following introduced environmental weed species were recorded on-site:

- *Pinus radiata*\*
- *Axonopus fissifolius*
- *Briza maxima*
- *Cenchrus clandestinus*

- 
- *Chloris gayana*
  - *Cirsium vulgare*
  - *Conyza bonariensis*
  - *Dichelachne crinita*
  - *Eragrostis curvula* ssp. *curvula*
  - *Erigeron sumatrensis*
  - *Holcus lanatus*
  - *Hypochaeris radicata*
  - *Modiola caroliniana*
  - *Paspalum dilatatum*
  - *Paspalum urvillei*
  - *Phalaris aquatica*
  - *Phytolacca octandra*
  - *Plantago lanceolata*
  - *Rumex* sp
  - *Setaria gracilis*
  - *Secale cereale*
  - *Sida rhombifolia*
  - *Sonchus oleraceus*
  - *Sporobolus fertilis*
  - *Trifolium repens*
  - *Senecio madagascariensis*
  - *Sporobolus fertilis*
  - *Holcus lanatus*\*
  - *Onopordum acanthium*\*
  - *Taraxacum officinale*
  - *Datura ferox*
  - *Bromus catharticus*
  - *Medicago arabica*
  - *Silybum marianum*
  - *Modiola caroliniana*
  - *Polygonum aviculare*
  - *Dactylis glomerata*
  - *Hirschfeldia incana*
  - *Nassella trichotoma* \*

\*Out of the exotic species recorded, four are listed as State Priority Weeds under the Biosecurity Act. The three State Priority Weeds are also Weeds of National Significance (WoNS). State and Regional Priority Weeds are required to be managed as detailed in the South-East Regional Strategic Weed Management Plan (NSW Local Land Services 2017) to comply with the General Biosecurity Duty that all land owners/managers and persons who deal with weeds are required to fulfil under the Biosecurity Act.

---

### 4.3 Plant Community Types (PCTs) and PCT selection

The NSW SVTM does not map any native vegetation on the subject land.

The NSW SVTM broadly identifies the locality as consisting of a plant community type (PCT) PCT 3374 - Goulburn Tableland Peppermint Grassy Forest as occurring on some of the neighbouring properties (Figure 11).

We have provided the full PCT report from the BioNet vegetation classification system to determine any consistencies between the planted native vegetation and remnant vegetation communities occurring in the surrounding area (refer to the full report provided on the following pages).

The planted *Eucalyptus* species occurring on-site are not consistent with the PCT classification (from the BIONET vegetation classification) which states that this vegetation community that usually comprises of the following:

- A sparse to mid-dense canopy almost always includes *Eucalyptus dives*, with occasional associates *Eucalyptus dalrympleana* or *Eucalyptus macrorhyncha*.
- The shrub layer is sparse to very sparse and commonly includes scattered *Hibbertia obtusifolia* and *Melichrus urceolatus*, occasionally with *Acacia dealbata* or *Daviesia latifolia*.
- The grassy ground layer almost always includes *Poa sieberiana*, commonly with *Microlaena stipoides*, *Rytidosperma pallidum*, *Themeda triandra* and occasional *Rytidosperma racemosum*.
- Common forbs include *Gonocarpus tetragynus*, *Lomandra filiformis*, *Hydrocotyle laxiflora*, *Hypericum gramineum*, *Scleranthus biflorus*, *Hardenbergia violacea*, *Viola betonicifolia*, and the small subshrub *Hovea linearis*.

**Of the species listed above only planted *Eucalyptus mannifera* (Brittle Gum), are consistent with a local vegetation community.**

No native understorey species were recorded on-site.

Overall the subject vegetation occurring on-site is not consistent with a native vegetation community, despite plantings of some eucalypt species that are locally indigenous.

However, based upon the geology/ soil landscapes and locally vegetation community occurrences we have entered/assigned the vegetation occurring on-site into the BAM calculator as PCT 3374 - Goulburn Tableland Peppermint Grassy Forest.

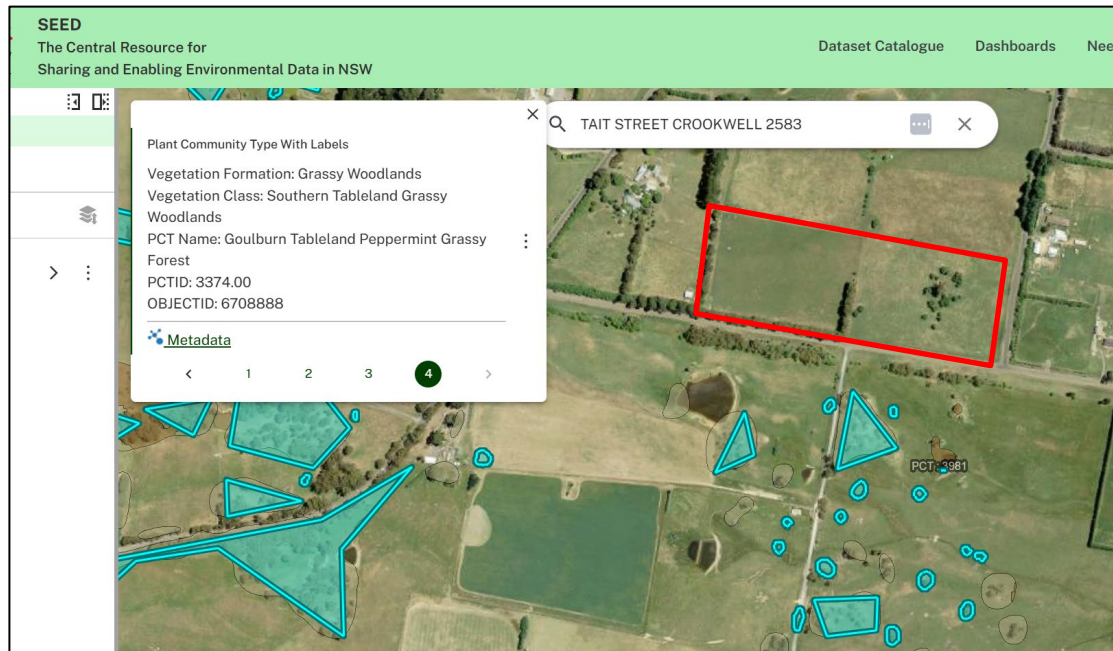

Figure 11: NSW State Vegetation Type Map for the subject site (Source: Department of Climate Change, Energy, the Environment and Water 2024 – SEED Mapping viewer)

---

### 3.1.2 Plot-based Floristic Vegetation Surveys

Plot-based floristic vegetation surveys were conducted, in accordance with s.5.2.1.9 of the BAM, by Jesse McIvor and Alex Fraser on the 6/11/24 and their location is shown in Figure 12.

One 20 m x 20 m plot was sampled for the presence of flora species. The plot was carefully examined to identify all flora species present. Searches continued until it was confident that all flora species within a plot were detected. Data collected for each species included:

- Stratum and layers in which each species occurs
- Growth form for each species
- Scientific and common name for each species
- Percentage foliage cover (PFC) across the plot, of each species rooted in or overhanging the plot
- Abundance rating for each species

Plant Community Types (PCTs) on the site were identified according to the NSW PCT classification described in the BioNet Vegetation Classification.

Plot data is provided in Appendix B.

**Figure 12: Location of BAM Plot Vegetation Zone 1 (red) and backup BAM Plot Vegetation Zone 2 (blue) Note: Only one BAM plot was required for the vegetation zone size**

**Photograph 1: BAM Plot midline of Vegetation Zone 1 (view north)**

**Photograph 2: BAM Plot midline of Vegetation Zone 1 (view south)**

**Photograph 7: View east across the subject property**

**Photograph 8: View north-east from the roadside towards the east and extent of the subject property**

---

## 3.2 Vegetation Integrity Assessment

### 3.2.1 Vegetation Zones

For the purposes of the BAM, a vegetation zone is an area of native vegetation on the site that is the same PCT and has a similar broad condition state. The assigned vegetation zones for the PCT 3320 occurring on the site are described below (Figure 14).

Figure 14: Location of vegetation zone and field validated PCT 3320 extent (shown in red)

---

### 3.2.2 Patch Sizes

A patch size area has been assigned to each vegetation zone, as a class. Patch size classes are provided in Table 3-1.

**Table 3-1: Patch Size Classes**

| PCT      | Vegetation Zone   | Patch Size Class |
|----------|-------------------|------------------|
| PCT 3374 | Vegetation Zone 1 | 30ha             |

---

### 3.2.3 Vegetation Integrity Scores

Each vegetation zone identified on the site has been surveyed to obtain a quantitative measure for each zone, of the composition, structure and function attributes listed in Table 3 of the BAM. These attributes are listed below:

- Growth form groups used to assess composition and structure:
  - Tree
  - Shrub
  - Grass and grass like
  - Forb
  - Fern
  - Other
- Attributes used to assess function:
  - Number of large trees
  - Tree regeneration
  - Tree stem size class
  - Total length of fallen logs
  - Litter cover
  - High threat exotic vegetation cover
  - Hollow-bearing trees

Plot-base surveys were conducted, in accordance with s.5.3.4 of the BAM, by an accredited ecologist (Jesse McIvor and Alex Fraser). Survey plots were established around a central 50 m transect and included:

- One 400 m<sup>2</sup> (20 m x 20 m) plot to assess the composition and structure attributes listed above.
- One 1000 m<sup>2</sup> (20 m x 50 m) plot to assess the function attributes: number of large trees, stem size class, tree regeneration and length of logs.
- Five 1 m<sup>2</sup> sub-plots to assess average litter cover (and other optional groundcover components).

See previous Figure 11 for plot location. Plot data is provided in Appendix B. Table 3-2 details the vegetation integrity scores for each vegetation zone.

---

**Table 3-2: Vegetation Integrity Scores**

| <b>PCT</b>      | <b>Vegetation Zone</b>        | <b>Composition<br/>Condition<br/>Score</b> | <b>Structure<br/>Condition<br/>Score</b> | <b>Function<br/>Condition<br/>Score</b> | <b>Vegetation<br/>Integrity<br/>Score</b> |
|-----------------|-------------------------------|--|--|---|---|
| <b>PCT 3374</b> | Vegetation Zone<br>1 (0.47ha) | 9.4  | 32.3                                     | 48                                      | 24.4                                      |

---

## 4 THREATENED SPECIES

### 4.1 Ecosystem Credit Species

Ecosystem credit species are those where the likelihood of occurrence of the species or elements of the species' habitat, can be predicted by vegetation surrogates and landscape features, or for which targeted survey has a low probability of detection. The Threatened Biodiversity Data Collection (TBCD) has identified several ecosystem credit species as requiring assessment as shown on below.

**Table 3: Ecosystem credit species to be considered from the BAM – C**

| <b>Common Name</b>                            | <b>Scientific Name</b>          | <b>Vegetation Types(s)</b>                       |
|---|---------------------------------|--|
| Black Falcon                                  | Falco subniger                  | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Black-chinned Honeyeater (eastern subspecies) | Melithreptus gularis gularis    | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Brown Treecreeper (eastern subspecies)        | Climacteris picumnus victoriae  | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Diamond Firetail                              | Stagonopleura guttata           | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Dusky Woodswallow                             | Artamus cyanopterus cyanopterus | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Flame Robin                                   | Petroica phoenicea              | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Gang-gang Cockatoo                            | Callocephalon fimbriatum        | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Grey-headed Flying-fox                        | Pteropus poliocephalus          | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Large Bent-winged Bat                         | Miniopterus orianae oceanensis  | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Little Eagle                                  | Hieraaetus morphnoides          | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Little Lorikeet                               | Glossopsitta pusilla            | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Painted Honeyeater                            | Grantiella picta                | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Rosenberg's Goanna                            | Varanus rosenbergi              | 3374-Goulburn Tableland Peppermint Grassy Forest |

---

| Common Name                         | Scientific Name                  | Vegetation Types(s)                              |
|-------------------------------------|----------------------------------|--|
| Scarlet Robin                       | Petroica boodang                 | 3374-Goulburn Tableland Peppermint Grassy Forest |
| South-eastern Glossy Black-Cockatoo | Calyptrorhynchus lathami lathami | 3374-Goulburn Tableland Peppermint Grassy Forest |
| South-eastern Hooded Robin          | Melanodryas cucullata cucullata  | 3374-Goulburn Tableland Peppermint Grassy Forest |
| Southern Whiteface                  | Aphelocephala leucopsis          | 3374-Goulburn Tableland Peppermint Grassy Forest |

## 4.2 Species Credit Species (Candidate Species)

Species credit species (or candidate species) are those where the likelihood of occurrence of the species or elements of suitable habitat for the species, cannot be confidently predicted by vegetation surrogates and landscape features and can be reliably detected by survey. The TBDC has identified several candidate species as requiring assessment as provided on the following page.

In accordance with S.6.5.1.1. a species survey must be undertaken for all species credit species identified as likely to occur on the site based upon the application of Steps 1-3 in Section 6.4. Based upon the low quality of fauna habitat proposed for removal, no species credit species are likely to occur on-site. Therefore, no targeted fauna surveys were considered necessary.

No hollow-bearing trees are proposed for removal. No significant fauna habitat is present on the Subject Land.

The site is mowed/slashed often as part of routine property maintenance and the habitat is highly degraded for native plant species.

It is not mapped under the Important Area habitat mapping.

Table 5 on the following page shows species credit species to be considered for this assessment and justification for their exclusion for further assessment.

As previously noted, the majority of the study area has previously been cleared for agricultural practices, with woodland and forest vegetation now limited to rows of isolated paddock trees.

The historic clearing and land degradation from agricultural practices, the matrix of woodland patches and cleared areas only supports habitat for a limited range of native vertebrate fauna species, including birds and microbats.

The remnant trees below the site function as a habitat corridor for mobile species including microchiropteran bats, flying foxes and variety of common bird species.

The Myrtaceae group of trees occurring downslope of the site provide nectar through flowering blossoms and direct extraction from the trunk for a variety of fauna including Grey-headed Flying Fox, birds and gliders.

There are a variety of nectar feeding species that utilise flowering blossoms are transient through the site and generally rely upon the flowering times.

The vegetation surrounding the site provides foraging and sheltering habitat for woodland bird species and generalist birds of agricultural habitats, although the smaller size of the remnants and general lack of connectivity may influence the suite of species.

---

Common birds found in these woodland habitats include White-throated Treecreeper (*Cormobates leucophaea*), Buff-rumped and Yellow Thornbill (*Acanthiza reguloides* and *Acanthiza nana*), Striated Pardalote (*Pardalotus striatus*), Grey Shrike-thrush (*Colluricincla harmonica*), Willy Wagtail (*Rhipidura leucophrys*), Yellow-faced Honeyeater (*Lichenostomus chrysops*), White-naped Honeyeater (*Melithreptus lunatus*), Crimson Rosella (*Platycercus elegans*), Magpie Lark (*Grallina cyanoleuca*) and Australian Magpie (*Gymnorhina tibicen*).

A total of 15 bird species were recorded across the study area during surveys. The species of birds recorded largely comprised common, widespread species in wooded agricultural landscapes in south eastern Australia.

The birds observed during the surveys (including incidental sightings) were flying moderate to short distances between trees, perching or moving between patches of vegetation. Sightings largely comprised scattered individuals or small groups (<5 individuals), apart from a sighting of relatively large flocks (>30 individuals) of Common Starlings and larger groups (~10-20 individuals) of Sulphur-crested Cockatoos and Galahs.

In addition to large flocks of Common Starlings, the following pest mammal species were detected:

- European Fox (*Vulpes vulpes*);
- European Hare (*Lepus europaeus*); and
- European Rabbit (*Oryctolagus cuniculus*).

No hollow-bearing trees or raptor nests are present on-site.

| Scientific Name                       | Common Name                     | BC Act Status         | EPBC Act Status       | Distribution  | Habitat and Ecology  | Habitat Constraints   | Optimal Survey (Months) | SAIL Entity? | Likely to occur on-site and biodiversity credits required?   |
|---------------------------------------|---------------------------------|-----------------------|-----------------------|---|--|---|-------------------------|--------------|--|
| <i>Miniopterus orianae oceanensis</i> | <i>Large Bent-winged Bat</i>    | Vulnerable            | -                     | Eastern Bentwing-bats occur along the east and north-west coasts of Australia.  | <p>Caves are the primary roosting habitat, but also use derelict mines, storm-water tunnels, buildings and other man-made structures. 1</p> <p>Form discrete populations centred on a maternity cave that is used annually in spring and summer for the birth and rearing of young. 2</p> <p>Maternity caves have very specific temperature and humidity regimes. 3</p> <p>At other times of the year, populations disperse within about 300 km range of maternity caves. 4</p> <p>Cold caves are used for hibernation in southern Australia. 5</p> <p>Breeding or roosting colonies can number from 100 to 150,000 individuals. 6</p> <p>Hunt in forested areas, catching moths and other flying insects above the tree tops.</p> | Cave, tunnel, mine, culvert or other structure known or suspected to be used for breeding including species records with microhabitat code "IC - in cave;" observation type code "E nest-roost;" with numbers of individuals >500 | Dec-Feb                 | Yes          | <p>The site does not occur within two kilometres of rocky areas containing caves, overhangs, escarpments, outcrops, or crevices, or within two kilometres of old mines or tunnels.</p> <p>No biodiversity credits required</p> |
| <i>Litoria castanea</i>               | <i>Yellow-spotted Tree Frog</i> | Critically Endangered | Critically Endangered | Historically, this species occurred in two separate highland ranges: on the New England Tableland, and on the southern and central tablelands from Bathurst to Bombala. Following the chytrid virus pandemic in the 1970s, this species went unrecorded for 30 years and was believed to be extinct, until it was rediscovered in 2009 on the Southern Tablelands. This population - near Yass - remains the only known extant site of the species. | <p>Require large permanent ponds or slow flowing 'chain-of-ponds' streams with abundant emergent vegetation such as bulrushes and aquatic vegetation. 1</p> <p>Adults are active during spring and summer and bask on sunny days.2</p> <p>Move and forage at night on grassy banks or float on the water's surface. 3</p> <p>Males call at night from the open water and breeding generally occurs during or following rain. 4</p> <p>Eggs are laid amongst aquatic vegetation. 5</p> <p>Shelter during autumn and winter under fallen timber, rocks, other debris or thick vegetation.</p>  | n/a   | Nov-Dec                 | Yes          | <p>Suitable habitat is absent</p> <p>No biodiversity credits required</p>  |

---

## **4.3 Description of Impacts**

### **4.3.1 Serious and irreversible impacts**

Species and ecological communities with a 'very high' biodiversity risk weighting will be a potential serious and irreversible impact (SAIL). These 'potential SAIL entities' are identified within the BAM calculator (DPE 2020).

The determination of serious and irreversible impacts on biodiversity values is to be made by the consent authority in accordance with the principles set out in the BC Regulation.

To assist the consent authority, the guidance document Guidance to assist a decision-maker to determine a serious and irreversible impact includes criteria that enable the application of the four principles set out in clause 6.7 of the BC Regulation to identify the species and ecological communities that are likely to be the subject of serious and irreversible impacts.

No SAIL entities occur in the Subject Land.

---

### 4.3.2 Potential Direct Impacts

#### Vegetation and habitat removal

The development impact area is a highly modified area that comprises of paddocks dominated by exotic pastureland and planted trees along the boundaries.

**As a precautionary measure, it has been assumed that 0.47ha PCT 3307 will require removal, despite the trees not being remnant and are planted.**

A Vegetation Management Plan can be provided at prior to the release of the Subdivision Certificate to address any native revegetation works.

The Arboricultural Impact Assessment prepared by Concept Arbor Consulting dated 17th November 2023 identifies the following vegetation impacts as follows:

- In its current form, the proposed subdivision will require the removal of eighty (85) trees along the McDonald Street on the south-western boundary to facilitate access to proposed lots 537 – 546 as well as the upgrade of McDonald Street and associated infrastructure.
- The required construction is approximately 1.5m from the trees; using the diameters of the larger trees in this grove, the encroachment is approximately 40% on the southern side and is within the structural root zones of some of the trees.
- A further twenty-nine (29) trees that dissect proposed lots 532 – 536 would require removal to establish building envelopes that meet the required setbacks. Of the trees requiring removal, four (4) are dead and displayed no evidence of habitat; the rest have been allocated a medium retention value.
- The trees are not remnant; they appear to have been planted as a wind break sometime in the early to mid-1970's. Looking at historical photographs, the trees appear around 1973 & are clearly visible by the late 1980's.
- Twenty (20) trees along the western boundary, at the rear of proposed lots 546, 550, 549 & 548 are unaffected by this stage of the subdivision and are suitable for retention.

Overall, the condition of the vegetation community that will be impacted by the proposed development is in poor condition. It has low native resilience and low ability to regenerate from the native soil seedbank.

An assessment of significance ('5 part test') was not required in accordance with Section 7.3 of the Biodiversity Conservation Act 2016 (BC Act) and Section 5.7 of the Environmental Planning and Assessment Act 1979 (EP&A Act) as a precautionary measure.

---

No hollow-bearing trees are proposed for removal.

The native vegetation community is in poor condition which is reflected in the low Vegetation Integrity Score.

The site does not contain derived native grasslands as defined under the Biodiversity Assessment Methodology (BAM 2020).

Figure 15: Tee location plan

### **Risk of runoff, erosion and sedimentation, during construction**

Surface water quality may be affected during construction activities. Construction activities could potentially encourage soil erosion and increase the sediment loads in downstream areas. Further, accidental leaks/spills of oil, fuel, cement or other substances entering watercourses could pollute surface waters.

The Construction Environment Management Plan (CEMP) that provided prior to the release of the Construction Certificate will address these issues.

### **Temporary noise, dust, light and vibration disturbance, during construction work**

---

Impacts of noise, dust, light and vibration upon fauna are difficult to predict. Potential impacts may include effects on predator-prey interactions and changes to mating and nesting behaviour.

The Construction Environment Management Plan (CEMP) that provided prior to the release of the Construction Certificate will address these issues.

### **Minor hydrological changes**

Hard surfaces created as a result of construction typically cause some hydrological changes; however, in this case, hydrological changes are expected to be very minor. All water run-off will be directed to the urban stormwater management system.

### **4.3.3 Indirect impacts**

Indirect impacts occur when the proposal or activities relating to the construction or operation of the proposal affect native vegetation, threatened ecological communities and threatened species habitat beyond the Subject Site.

Impacts may also result from changes to land-use patterns, such as an increase in vehicular access and human activity on native vegetation, threatened ecological communities and threatened species habitat (Table 5.1.2 below).

**Table 5.1.2 Indirect impacts, extent and duration and consequences**

| Indirect Impact   | Extent and duration   | Threatened species, threatened ecological communities and their habitats likely to be affected. | Consequences of the impacts for the bioregional persistence of the threatened species, threatened ecological communities and their habitats. |
|---|---|---|--|
| (a) inadvertent impacts on adjacent habitat or vegetation                   | The proposed development may lead to enhanced weed infiltration into adjacent habitat by enhanced edge effects. This impact is likely to be restricted the immediate area surrounding the indicative development footprint to a couple of metres. | Nil   | Edge effects will not be created and increase weed intensity and reduce vegetation integrity.  |
| (b) reduced viability of adjacent habitat due to edge effects               | The proposed development may lead to enhanced weed infiltration into adjacent habitat by enhanced edge effects. This impact is likely to be restricted the immediate area surrounding the indicative development footprint to a couple of metres. | Nil   | Edge effects will not be created and increase weed intensity and reduce vegetation integrity.  |
| (c) reduced viability of adjacent habitat due to noise, dust or light spill | The proposed works are unlikely to significantly exacerbate any of these issues which are all currently in effect within surrounding lots, or otherwise unlikely to occur within the Subject Site.  | Nil   | Nil  |

| Indirect Impact   | Extent and duration  | Threatened species, threatened ecological communities and their habitats likely to be affected. | Consequences of the impacts for the bioregional persistence of the threatened species, threatened ecological communities and their habitats.                                      |
|---|--|---|---|
| (d) transport of weeds and pathogens from the site to adjacent vegetation | The proposed development may lead to enhanced weed infiltration into adjacent habitat by enhanced edge effects. This impact is likely to be restricted the immediate area surrounding the indicative development footprint to a couple of metres. Active weed control efforts will be undertaken prior to and post construction.   | Nil   | Edge effects will not be created and increase weed intensity and reduce vegetation integrity.   |
| (e) increased risk of starvation, exposure and loss of shade or shelter   | This issue is unlikely to occur on the Subject Site. It is unlikely that any threatened fauna relies on habitat within the Subject Site, such that the proposed impacts will lead to increased risks from starvation, exposure, shade and shelter. All habitat resources removed will be replaced through implementation of the recommendations outlined in this report. | Nil   | Nil   |
| (f) loss of breeding habitats   | Only one tree with a hollow spout is proposed for removal. No caves will be impacted by the proposal.  | Nil   | The implementation of the actions prescribed in this report should see an increase in the availability of potential habitat for these threatened species within the Subject Site. |

| Indirect Impact   | Extent and duration   | Threatened species, threatened ecological communities and their habitats likely to be affected. | Consequences of the impacts for the bioregional persistence of the threatened species, threatened ecological communities and their habitats. |
|---|---|---|--|
| (g) trampling of threatened flora species                       | This issue is not likely to affect the Subject Site. No threatened flora species were identified within the Subject Site. | Nil   | Nil  |
| (h) inhibition of nitrogen fixation and increased soil salinity | This issue is not likely to affect the Subject Site.  | Nil   | Nil  |
| (i) fertiliser drift  | This issue is not likely to affect the Subject Site.  | Nil   | Nil  |
| (j) rubbish dumping   | This issue is not likely to affect the Subject Site.  | Nil   | Nil  |
| (k) wood collection   | This issue is not likely to significantly affect the Subject Site.  | Nil   | Nil  |
| (l) bush rock removal and disturbance                           | No bush rock occurs on-site.  | Nil   | Nil  |
| (m) increase in predatory species populations                   | It is unlikely that the proposed works will influence or alter predatory species populations.                             | Nil   | Nil  |
| (n) increase in pest animal populations                         | It is unlikely that the proposed works will influence or alter pest species populations.                                  | Nil   | Nil  |
| (o) increased risk of fire                                      | This issue is not relevant to the Subject Site as there is little identified bushfire hazard.                             | Nil   | Nil  |
| (p) disturbance to specialist breeding and foraging             | There is no specialist breeding or foraging habitat on the Subject Site. The site contains a                              | Nil   | Nil  |

---

| Indirect Impact                             | Extent and duration   | Threatened species, threatened ecological communities and their habitats likely to be affected. | Consequences of the impacts for the bioregional persistence of the threatened species, threatened ecological communities and their habitats. |
|---|---|---|--|
| habitat, e.g. beach nesting for shorebirds. | stand of mixed, nectar producing canopy trees which can provide intermittent nectar resources for several threatened fauna species. |   |  |

---

#### 4.3.4 Prescribed and Uncertain Impacts

This list of impacts includes all of those impacts on biodiversity values not caused by direct vegetation clearing or development that have been prescribed by the Biodiversity Conservation Regulation 2017 (Table 5.1.3).

**Table 5.1.3 Potential Prescribed or Uncertain Impacts of the Proposed Action**

| Will there be impacts on any of the following   | Yes/No | If Yes, must address all of the assessment questions from section 9.2.1 of the BAM   |
|---|--------|--|
| Species or ecological communities associated with karst, caves, crevices, cliffs and other features of geological significance  | No     | n/a  |
| Habitat of threatened species or ecological communities associated with rocks   | No     | n/a  |
| Habitat of threatened species or ecological communities associated with human made structures   | No     | n/a  |
| Habitat of threatened species or ecological communities associated with non-native vegetation   | No     | n/a  |
| Connectivity of different areas of habitat of threatened species that facilitates the movement of those species across their range  | Yes    | Habitat connectivity continues to exist across the site. It is unlikely that the small area of impact will interrupt connectivity for any threatened fauna or flora species. |
| Movement of threatened species that maintains their life cycle  | Yes    | Habitat connectivity continues to exist across the site. It is unlikely that the small area of impact will interrupt movement of any threatened fauna or                     |
| Water quality, water bodies and hydrological processes that sustain threatened species and threatened ecological communities (including subsidence or upsidence resulting from underground mining or other development) | No     | n/a  |
| Wind turbine strikes on protected animals   | No     | n/a  |

---

| Will there be impacts on any of the following   | Yes/No | If Yes, must address all of the assessment questions from section 9.2.1 of the BAM |
|---|--------|--|
| Vehicle strikes on threatened species of animals or on animals that are part of a TEC | Yes    | n/a  |

## 4.4 Avoidance of Impacts

The Arboricultural Impact Assessment prepared by Concept Arbor Consulting dated 17th November 2023 identifies the following vegetation impacts as follows:

- Twenty (20) trees along the western boundary, at the rear of proposed lots 546, 550, 549 & 548 are unaffected by this stage of the subdivision and are suitable for retention.

Overall, the condition of the vegetation community that will be impacted by the proposed development is in poor condition. It has low native resilience and low ability to regenerate from the native soil seedbank.

## 4.5 Minimisation of Impacts

Several mitigation measures are proposed to minimise potential impacts; these are summarised in Table 5-1. These include measures to be implemented in the pre-construction, construction and post-construction phases. It is considered that these measures would serve to minimise any potential direct or indirect impacts.

| Action           | Outcome/measure  | Risk/<br>consequence of<br>residual impacts  | Timing                 | Responsibility |
|------------------|--|--|------------------------|----------------|
| Project location | The location of the proposed development has been positioned in order to avoid and minimise the potential resulting impacts on biodiversity values within the Subject Site, where possible.  | Risk = low<br><br>Consequence =<br>Harm to native vegetation and native fauna                  | Pre-construction phase | Proponent      |
| Project design   | The proposed development has been designed to avoid and minimise impacts on native vegetation and habitat where possible within the Subject Site. Where this is not possible, mitigation measures have been designed and recommended to reduce potential ecological impact.<br><br>While there will be some impact on native vegetation, this falls above the Biodiversity Offset Scheme threshold. The design of the proposed development includes the retention of a significant area of existing bushland without disturbance. This area of retained bushland will allow for the implementation of mitigation measures that will aim to reduce any ecological impact resulting from the proposed development. | Risk = low<br><br>Consequence =<br>Harm to native vegetation and native fauna                  | Pre-construction phase | Proponent      |
| Tree protection  | Australian Standard 4970 (2009) Protection of Trees on Development Sites (AS-4970) outlines that a Tree Protection Zone (TPZ) is the principal means of  | Risk = low<br>Consequence =<br>Harm to native vegetation and native fauna.<br>Proliferation of | Pre-construction phase |                |

| Action                                       | Outcome/measure  | Risk/<br>consequence of<br>residual impacts  | Timing   | Responsibility           |
|--|--|--|--|--------------------------|
|  | protecting trees on development sites. It is an area isolated from construction disturbance so that the tree remains viable. Ideally, works should be avoided within the TPZ. A Minor Encroachment is less than 10% of the TPZ and is outside the SRZ. A Minor Encroachment is considered acceptable by AS-4970 when it is compensated for elsewhere and contiguous within the TPZ. A Major Encroachment is greater than 10% of the TPZ or inside the SRZ. Major Encroachments generally require root investigations undertaken by non-destructive methods or the use of tree sensitive construction methods.. | weeds.   |  |                          |
| <b>Avoidance of hollow-bearing trees</b>     | No hollow-bearing trees occur within the proposed development footprint.   | Risk = low<br><br>Consequence = Loss of fauna habitat. Loss of native vegetation.        | Construction phase                                       | Proponent                |
| <b>Avoidance of woody debris</b>             | Woody debris within the development footprint should be relocated, by the proponent to the area of native vegetation in the northern extent of the Subject Site.   | Risk = low<br><br>Consequence = Loss of fauna habitat.                                   | Construction phase                                       | Proponent                |
| Erosion and sedimentation                    | Appropriate erosion and sediment control must be erected and maintained at all times during construction. As minimum such measures should comply with the relevant industry guidelines such as 'the Blue Book' (Landcom 2004).   | Risk = low<br><br>Consequence = Degradation of vegetation,                               | Construction phase                                       | Construction Contractor  |
| Erosion protection fencing                   | Temporary fencing should be erected around the extent of native vegetation to be retained in order to minimise any disturbance resulting from the proposed construction works.   | Risk = high<br><br>Consequence = Permanent damage or degradation of vegetation.          | Construction phase                                       | Construction Contractor  |
| Storage and Stockpiling (Soil and Materials) | Allocate all storage, stockpile and laydown sites away from any native vegetation that is planned to be retained. Avoid importing any soil from outside the site as this can introduce weeds and pathogens to the site.  | Risk = moderate<br><br>Consequence = Harm to native vegetation and native fauna          | Construction phase                                       | Construction Contractors |
| Weed eradication and suppression             | All priority weeds should be eradicated across all areas of the Subject Site. Very low weed invasion was recorded on-site. Any weeds should be continually suppressed and prevented from re-establishing within retained native vegetation.  | Risk = moderate<br><br>Consequence = Harm to native vegetation and native fauna habitat. | Construction phase<br><br>and<br>Post-construction phase | Proponent                |

---

| Action     | Outcome/measure  | Risk/<br>consequence of<br>residual impacts   | Timing                  | Responsibility                      |
|------------|--|---|-------------------------|-------------------------------------|
| Stormwater | The proposed development is unlikely to result in significant changes to stormwater runoff so it is expected there will be no exacerbated impact on native species of flora and fauna. Stormwater flow from future indicative building footprints and hard surfaces will be directed to newly installed water storage tanks. Prior to any release, all stormwater is to be piped through any tanks that may be required by the regulating authorities. | Risk = low<br><br>Consequence = Harm to native vegetation and native fauna habitat. | Post-construction phase | Proponent<br>Construction Architect |
| Wastewater | All sewerage produced on site will be contained in with the new wastewater treatment area. The certified sprinkler system will eliminate any adverse effects to the local ecology. Trees will be retained in this area.  | Risk = low<br><br>Consequence = Harm to native vegetation and native fauna habitat. | Post-construction phase | Proponent                           |

---

## 5 IMPACT SUMMARY

### 5.1 Impacts Which Require an Offset

Tables 5.1 and 5.2 provide a summary of the impacts that require an offset, under the BAM.

**Table 5-1: Vegetation Zones Requiring an Offset**

| PCT      | Vegetation Zone   | Composition Condition Score | Structure Condition Score | Function Condition Score | Vegetation Integrity Score | Number of biodiversity credits required |
|----------|-------------------|-----------------------------|---------------------------|--------------------------|----------------------------|---|
| PCT 3374 | Vegetation Zone 1 | 9.4                         | 32.3                      | 48                       | 24.4                       | 4                                       |

---

**Table 5-2: Threatened Species Requiring an Offset**

| Species | Area of Impacted Habitat | Number of Species Credits Required |
|---------|--------------------------|------------------------------------|
| NIL     | NIL                      | 0                                  |

## **5.2 Impacts Not Requiring an Offset**

| 5 – 9 cm   |                   |                     |
| <5 cm  |                   |                     |
| Length of logs (m) ( $\geq$ 10 cm diameter, >50cm in length) | Tally: 0          | Total: 0            |

Counts apply when the number of tree stems within a size class is  $\leq$  10. Estimate can be used when  $>$  10 (eg. 10, 20, 30....100, 200). For a multi-stemmed tree, only the largest living stem is included in the count / estimate. Tree stems must be living.

For hollows, count only the presence of a stem containing hollows. For a multi-stemmed tree, only the largest stem is included in the count/estimate. Stems may be dead and may be shrubs.

# Alexander Fraser

alohafraser@gmail.com

0423238193

665 The Scenic Rd Macmasters Beach, NSW 2251

## Key skills

- 12+ years private ecological consulting (Fraser Ecological Consulting)
- 15 + years local government ecological assessment for DAs (Hornsby Shire Council – current employer)
- 10 + years Land & Environment Court expert witness experience
- 2 years state government ecological assessment (NSW OEH)
- High level botanical field identification skills, plot surveys and project management
- Fauna survey and field assistant experience
- Biodiversity Assessment Reporting (BDAR) preparation and Stewardship Site (BSAR) under the NSW BOS Credit Scheme

## Qualifications

Bachelor Environmental Science  
(Honours) Southern Cross University

Certificate 3 Natural Area Restoration

Certificate 3 Vertebrate Animal Pest  
Control (NSW DPI, Orange)

NPWS Scientific Licence - S10445

Animal Ethics Authority - 11/4299

Accredited under the Biodiversity  
Assessment Methodology - BAM  
(Accreditation No. BAAS18156)

Practising member of NSW Ecological  
Consultants Association (ECA)

## Summary

Alex Fraser (Principal Ecologist, Fraser Ecological) has extensive experience in DA related ecological assessment as both an assessor (Hornsby Shire Council) and private consultancy (Fraser Ecological) which actively and currently involve a wide array projects. Fraser Ecological is based locally on the Central Coast, however, project experience extends to South Coast, Blue Mountains, Mid-north Coast and mainly in the Sydney Basin Bioregion.

Previous work roles include ecological consulting for Parsons Brinckerhoff (large infrastructure), NPWS threatened species unit (biodiversity surveys), former NSW Department of Climate Change/ OEH (SIS DGRs and major projects assessment) and Hornsby Shire Council (DA assessment officer) have focussed primarily on ecological survey, development assessment, project management and policy development for consent authorities.

Alex offers high level botanical ID and field survey skills which includes targeted surveys and BAM plot surveys. Fraser Ecological has extensive experience in the preparation of over 15 BDARs under the new BC Act 2016 BOS credit trading scheme. Alex has experience dealing with consent authorities including Council, Crown Lands, Metropolitan Land Council, RFS, Biodiversity Conservation Trust and Department of Planning for major projects including SSDI proposals.

Fraser Ecological has established a wide network of ecological specialists including the Royal Botanic Gardens and Australian Museum as well academic institutions for expert advice when required. Alex is a current member of the North Sydney Regional Land Managers Group that includes staff from Central Coast Council, Northern Beaches, Ku-ring-gai Council, Hornsby Council (HSC), NPWS and Crown Lands) as project manager developing the Natural Area Recreation Strategy for HSC. Current main role at Council is development assessment and review of Flora and Fauna Reports and Biodiversity Assessment Reports.

Fraser Ecological has been engaged by various Councils (Central Coast, Ku-ring-gai, Liverpool City, Blacktown City Council, Hornsby Shire Council and Hawkesbury City Council) to undertake biodiversity assessments for major civil works projects. He is continuously providing biodiversity assessments for private clients for a range of development proposals across coastal and western NSW. We have also undertaken threatened flora and fauna species survey and monitoring for the NSW OEH Save our Species grants.

### Key skills:

- Targeted flora and fauna surveys
- BAM plots in accordance with the BAM
- Ecological monitoring & Opportunity and Constraints mapping
- Preparation of BDARs, BAM calculator and credit reporting
- Retirement of credits for approved projects via BCT and brokers
- Establishment of stewardship sites and other offset packages
- Expert witness reporting and attendance in the LAEC
- Compliance investigations and auditing
- Preparation of Vegetation Management Plans
- Preparation of Nestbox Monitoring Plans

# CERTIFICATE OF ACCREDITATION AS A BIODIVERSITY ASSESSMENT METHOD ASSESSOR under the *Biodiversity Conservation Act 2016* (NSW)

| BAM Assessor         |                                    |                  |
|----------------------|------------------------------------|------------------|
| Alex FRASER          |                                    |                  |
| Accreditation number | Accreditation date (Date of issue) | Expiry Date of   |
| BAAS18156            | October 18, 2024                   | October 17, 2027 |

The person named above is accredited under section 6.10 of the *Biodiversity Conservation Act 2016* (NSW) (**BC Act**) as a Biodiversity Assessment Method Assessor to apply the Biodiversity Assessment Method in connection with the preparation of biodiversity stewardship site assessment reports, biodiversity development assessment reports and biodiversity certification assessment reports pursuant to Part 6 of the BC Act.

The accreditation is in force until and including the Expiry Date. The accreditation is subject to the conditions set out in the *Accreditation Scheme for the Application of the Biodiversity Assessment Method*, under the BC Act, and the conditions specified on the reverse of this certificate.

## STEEN GYRN

Senior Team Leader, Accreditation and Training  
Biodiversity and Conservation Division | Department of Climate Change, Energy, the Environment and Water

## NOTES

- DCCEEW maintains a register of Accredited Biodiversity Assessment Method (BAM) Assessors accessible from the DCCEEW website.
- The BAM Assessor's accreditation expires on the Expiry Date unless renewed in accordance with the *Accreditation Scheme for the Application of the Biodiversity Assessment Method*. It is the BAM Assessor's responsibility to monitor the Expiry Date of their accreditation, and apply for any renewal with sufficient time for the application to be processed prior to the Expiry Date.
- Words and expressions used in this accreditation instrument and which are also used in the Act have the same meaning.

## SUMMARY OF CONDITIONS UNDER SCHEME

The following are conditions of all accreditations granted under the Scheme:

1. an accredited person must prepare Biodiversity Assessment Reports (and conduct surveys and other activities in connection with the preparation of such reports) in accordance with:
  - a. the Biodiversity Assessment Method Manual,
  - b. the Credit Calculator Operational Manual,
  - c. Accredited Person Code of Conduct.
  - d. this Scheme,
  - e. any guidance materials published by the Department of Climate Change, Energy, the Environment and Water in connection with preparation of Biodiversity Assessment Reports or the application of the BAM
  - f. any accreditation requirements notified by the Department of Climate Change, Energy, the Environment and Water to the accredited assessor from time to time.
2. an accredited person must maintain a detailed and up to date working knowledge of, and comply with, all relevant legislation.
3. an accredited person must maintain records of surveys and assessments, including field data sheets and targeted flora and fauna surveys, undertaken and used as part of the preparation of a Biodiversity Assessment Report, for at least ten years after certification of the relevant Biodiversity Assessment Report.
4. all records required to be kept by an accredited person must be in legible form, or in a form that can be readily reduced to a legible form.
5. an accredited person must provide to the Department of Climate Change, Energy, the Environment and Water any information related to biodiversity assessment reports required to be provided by all accredited persons, or by a group of accredited persons, by way of a notice specified on a website maintained by it, in the form and within the time frames required in that notice.
6. an accredited person must comply with any scientific licence conditions relating to survey records.
7. an accredited person must possess, or operate under, an appropriate scientific licence as required for the type work, they are completing in the Biodiversity Offsets Scheme.

**Note.** Information that the Environment Agency Head (EAH) may require to be provided may include information collected during the application of the BAM such as site specific survey data.

**Note.** In addition to the conditions above, accredited persons must comply with obligations under the BC Act and regulations, including Part 6 Division 3 of the BC Act. Failure to comply with any of the conditions above may result in the EAH exercising the power to vary, suspend or cancel that accreditation under Part 5 of this Scheme.
