## 1 PREAMBLE

#### 1.1 INTRODUCTION

This Sustainable Development Plan (this is equivalent to an ESD report) has been prepared to support a Review of Environmental Factors (REF) for the NSW Department of Education (DoE) for Greenway Park Public School upgrade (the activity).

The purpose of the REF is to assess the potential environmental impacts of the activity prescribed by State Environmental Planning Policy (Transport and Infrastructure) 2021 (T&I SEPP) as "development permitted without consent" on land carried out by or on behalf of a public authority under Part 5 of the Environmental Planning and Assessment Act 1979 (EP&A Act). The activity is to be undertaken pursuant to Chapter 3, Part 3.4, Section 3.37 of the T&I SEPP.

This document has been prepared in accordance with the Guidelines for Division 5.1 assessments (the Guidelines) by the Department of Planning, Housing and Infrastructure (DPHI) as well as the Addendum Division 5.1 guidelines for schools. The purpose of this report is to identify all the sustainability initiatives that are proposed and under consideration for the activity.

#### 1.2 PROPOSED DEVELOPMENT DESCRIPTION

The proposed activity for the Greenway Park Public School upgrade includes:

#### **DEMOLITION/ EARTHWORKS**

- Demolish part of boundary fence on Chapman Street for new vehicular crossover;
- Demolish parts of boundary fence on Chapman Street for new gates;
- Demolish shade structure and associated concrete slab and footpath;
- Demolish footpaths;
- Trenching for underground services; and
- Earthworks associated with new buildings and landscaping.

#### **CONSTRUCTION**

- Construction and operation of single storey classroom building with associated covered walkways:
- Construction and operation of a new preschool building, including covered walkways, new carpark (12 spaces and one (1) accessible space) and vehicular crossover to Chapman Street;
- Installation of artwork on Block H and Block J facades, as well as a preschool retaining wall;
- Laying of services within trenches;
- New pedestrian entry points;
- Fencing and gates;
- Underground OSD tanks;
- Rainwater tanks;
- Shed for preschool:
- Outdoor play equipment for the preschool;
- New fire hydrant booster & associated building services connections;
- Retaining walls associated with the preschool;
- Signage;
- Landscaping; and
- Associated earthworks

#### 1.2.1 WORKS UNDER SEPARATE PLANNING PATHWAY (NOT PART OF THIS REF)

To enable the proposed activity to proceed, the seven (7) existing portable classrooms, associated walkways, a shade structure and associated concrete slab will be removed from site and five (5) new portable classrooms and associated walkways will be installed adjacent to block F under a separate planning pathway. A tree removal permit for the removal of three (3) trees will be sough separately. These works do not form part of this REF application and have not been assessed in this report.

#### 1.3 ACTIVITY SITE

The activity site is located on Wyattville Drive, West Hoxton and is legally described as:

- Lot 11 DP 858025; and
- Lot 20 DP 867282

Greenway Park Public School is located on the south eastern side of Chapman Street and the north easter side of Wyattville Drive. The surrounding context of the site is predominantly low density residential aswell as a childcare centre to the north.

FIGURE 1 - AERIAL PHOTOGRAPH

## 1.4 S171(2) ENVIRONMENTAL FACTORS

This report examines and takes into account the relevant environmental factors in the Guidelines and Section 170, Section 171 and Section 171A of the Environmental Planning and Assessment Regulations 2021 (EP&A Regulation as outlined below.

REGULATION / GUIDELINE SECTION	REQUIREMENT	RESPONSE	REPORT SECTION

## 2 EXECUTIVE SUMMARY

NDY has been engaged by NSW Department of Education (DoE) to develop a Sustainable Development Plan (SDP) for the proposed Greenway Park Public School activity.

The principal objective of this report is to address the minimum requirements set out in the following:

- Clause 193 and s171(2) of Division 5 of the Environmental Planning and Assessment Regulation 2021
- SINSW Sustainable Development Practice Note
- SINSW Education Facilities Standard and Guideline (EFSG)
- Government Architect NSW (GANSW) Design Guide for Schools and Environmental Design in Schools Manual
- NSW Government Resource Efficiency Policy (GREP 2019)

The activity will be designed and delivered in line with the standard SINSW sustainability brief, detailed in the SINSW Sustainable Development Practice Note, with key scope including:

- 5-Star Green Star Buildings v1 certification
- SINSW EFSG compliance
- NCC Section J compliance

Through early design input from sustainability professionals, key initiatives incorporated in the proposed activity include:

- Passive design elements, such as high-performance façade, effective shading and natural ventilation to reduce the energy demand of the buildings and improve indoor environment quality for students and staff.
- Energy efficient building systems and on-site renewable energy to reduce greenhouse gas emissions.
- Consideration of the building design's resilience and adaptation to climate change impacts.
- High indoor air quality, acoustic design principles, visual amenity and thermal comfort to support the site
  functions as training and teaching spaces and private staff areas.
- Best practice waste management principles in operation, and construction and demolition waste diversion from landfill.
- Water efficient fixtures and fittings (high WELS ratings), and rainwater collection from the roof and stored for use on-site (landscaping irrigation, toilet flushing) to reduce potable water consumption.
- Incorporation of stormwater management systems and water sensitive urban design (WSUD) to minimise peak stormwater flows and pollutants.
- Social sustainability initiatives such as incorporation of indigenous design elements, implementation of
  universal design principles and community benefits via community use of the school facilities.

The ESD initiatives of the proposed activity will be verified through a Green Star Buildings v1 certification. The activity is targeting a 5-Star rating, which is deemed to represent Australian Best Practise by the Green Building Council of Australia (GBCA).

Green Star is one of the most widely adopted sustainability framework in Australia, covering a broad range of sustainability initiatives. Green Star Buildings incorporates a mixture of initiatives in line with the intent of WELL (healthy environment for occupants), NABERS (efficient building in operation), Passive House (high performing facade & mechanical systems), as well as other sustainability frameworks.

## 3 PROJECT SUMMARY

#### 3.1 PURPOSE OF THIS REPORT

The principal objective of this report is to detail the sustainability strategy of the proposed activity, in order to address the minimum requirements set out in the following:

- Clause 193 and \$171(2) of Division 5 of the Environmental Planning and Assessment Regulation 2021
- SINSW Sustainable Development Practice Note
- SINSW Education Facilities Standard and Guidelines (EFSG)
- Government Architect NSW (GANSW) Design Guide for Schools and Environmental Design in Schools Manual
- NSW Government Resource Efficiency Policy (GREP) 2019

#### 3.2 PROJECT DESCRIPTION

The site is located at Wyattville Drive, West Hoxton NSW, and is under the jurisdiction of Liverpool City Council. The school is located within climate zone 5 – warm temperate conditions, which is associated with:

- High diurnal ranges inland and four distinct seasons
- Summer and Winter that can exceed human comfort range, while spring and autumn are ideal for human comfort
- Mild to cool winters with low humidity
- Hot to very hot summers, with moderate humidity

Refer to Figure 1 for an overview of the site plan.

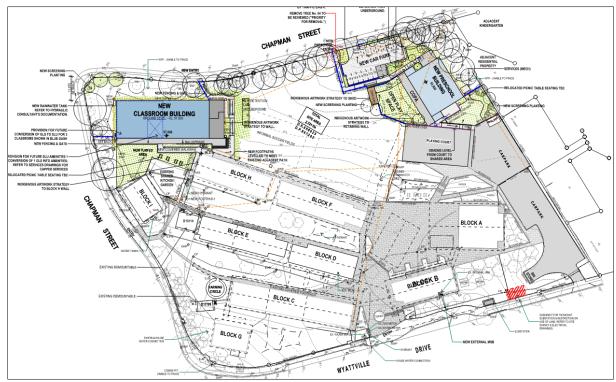

FIGURE 1: SITE PLAN OF GREENWAY PARK PUBLIC SCHOOL UPGRADE

## 3.3 INFORMATION SOURCES

The following information sources have been used in the preparation of this report:

- Clause 193 and \$171(2) of Division 5 of the Environmental Planning and Assessment Regulation 2021
- NSW Department of Education School Infrastructure documents:
  - Sustainable Development Practice Note
  - Education Facilities Standard and Guidelines (EFSG) Design Guide
  - GANSW Design Guide for Schools
  - GANSW Environmental Design in Schools Manual
  - DFMA Guidelines
- NSW Government Resource Efficiency Policy (GREP) 2019
- National Construction Code (NCC) 2022 Section J
- Green Star Buildings v1 Rev C Submission Guidelines
- Architectural drawings prepared by Fulton Trotter Architects
- Discussions and feedback with the design team.

## 4 SUSTAINABILITY PRINCIPLES

The following section of the report details how the proposed activity responds to the relevant sustainability principles as defined in Clause 193 of Division 5 of the Environmental Planning and Assessment Regulation 2021.

#### 4.1 THE PRECAUTIONARY PRINCIPLE

The design has been reviewed against holistic sustainability principles to ensure a robust sustainability outcome is delivered. The sustainability initiatives proposed for the new Greenway Park Primary School activity aims to reduce the environmental impacts typically associated with buildings during the construction and ongoing operation of the building.

Sustainability measures have been incorporated, spanning across the project's design, construction and operations, based around the core principles of:

- Efficient use of resources (energy, water and materials)
- Enhancing indoor environment quality and occupant comfort
- Minimising ecological impacts.

In line with the Green Star pathway, the head contractor will implement an Environmental Management Plan (EMP) ensuring there will also be a systematic approach to environmental considerations throughout construction.

A climate change risk assessment is scheduled to assess the anticipated impacts of climate change and implement design strategies to mitigate these impacts. Refer to Section 7 for details.

## 4.2 INTER-GENERATIONAL EQUITY

Student and staff health has been considered through the incorporation of indoor environmental quality design features such as daylight and glare analysis for natural lighting, best-practice lighting design, indoor air quality, thermal comfort assessment, acoustic design, and responsible material selection to reduce internal pollutants and resource depletion for future generations.

In relation to cultural diversity, the activity will aim to incorporate the NSW Department of Education organisational Reconciliation Action Plan and use it as an opportunity to further embrace the objectives, including:

- Procurement of all materials and labour will be in accordance with the NSW DoE Aboriginal Procurement Policy and NSW DoE Main Works 21 Preliminaries Section 4.4 'Aboriginal Participation'
- A project-specific Aboriginal Participation Plan will be developed to monitor and report on the minimum Aboriginal participation requirements.

1. Note that the Green Star 'Procurement and Workforce Inclusion' requirements are more onerous than the mandatory DoE ones (requires at least 2% of total contract value to generate employment to disadvantaged groups, as opposed to the DoE's 1.5% requirement.

Universal design principles will be implemented to provide safe, equitable and dignified access for persons with disabilities. Conservation of Biodiversity and Ecological integrity

The proposed design does consider design strategies to minimise the urban heat island effect, such as the use of light-coloured external finishes. High quality access to external views will be considered to increase student engagement with the natural environment.

With an open play space adjacent to the early learning centre, to provide connection with nature to the students.

Landscaping is to be incorporated into the site both horizontal and vertical to a targeted 15% of the site, with the aim of 60% of plants being indiaenous.

Construction and operational environmental management systems and plans will be detailed and implemented by the head contractor.

## 4.3 IMPROVED VALUATION, PRICING, AND INCENTIVE MECHANISMS

Total cost of operation will be reduced through sustainable considerations to reduce energy, water and waste requirements, taking into consideration whole-of-life costing. The activity will ensure sustainable principles are

extended to include value for money, fit for purpose, long term reliability/resilience and flexibility. Designing with the long-term operation of the building in mind will create further buy-in and cooperation from the operating stakeholders. Strategies to reduce operational waste have been considered such as the development of an operational waste management plan and separation of waste streams.

## 5 SUSTAINABILITY FRAMEWORKS & LEGISLATION

Relevant sustainability frameworks and legislation applicable to the proposed activity are detailed in the following sub-sections.

#### 5.1 NCC SECTION J

The National Construction Code (NCC) is produced and maintained by the Australian Building Codes Board (ABCB) on behalf of the Australian Government with the aim of achieving nationally consistent, minimum necessary standards of relevant health and safety, amenity and sustainability objectives efficiently. Section J of the NCC Volume 1 sets out the minimum energy efficiency requirements for all commercial buildings in Australia.

The activity will achieve compliance with NCC 2022 (as required) Section J either through Deemed-to-Satisfy (DTS) Provisions, or a Performance Solution J1V2, J1V3 or similar.

## 5.2 EDUCATIONAL FACILITY STANDARDS AND GUIDELINES (EFSG)

The Educational Facilities Standards and Guidelines (EFSG) are intended to assist those responsible for the management, planning, design, construction and maintenance of new and refurbished school facilities. The EFSG is a suite of information compiled into Design Guides to aid in the planning, design and use of NSW Department of Education school facilities.

The guides aim to provide functional and durable facilities within a systematic whole of life, value for money framework that takes into account enhancement of learning and teaching, planning and development, sustainability and facilities management.

## 5.3 NSW GOVERNMENT RESOURCE EFFICIENCY POLICY (GREP)

The aim of the NSW Government Resource Efficiency Policy (GREP) is to reduce the NSW Government's operating costs and lead by example in increasing the efficiency of its resource use.

The policy intends to drive resource efficiency by NSW Government agencies in four main areas – energy, water, waste and air emissions from government operations. The policy describes measures to achieve set targets and minimum standards.

#### 5.4 GREEN STAR BUILDINGS V1

Green Star is a voluntary sustainability rating tool for buildings, tenancies and communities in Australia. It was launched in 2003 by the Green Building Council of Australia (GBCA), a not-for-profit organisation with the key objective of driving the transition of the Australian property industry towards the design and construction of a more sustainable built environment.

Although initially developed specifically for the design and construction of office buildings, the Green Star suite of rating tools has now expanded to cover all habitable buildings and communities across a design, as built and operational performance life cycle.

Green Star is a holistic rating system, covering a wide range of sustainability themes and initiatives. The key categories included under the Green Star Buildings framework are as follows.

- **RESPONSIBLE**: Recognizes activities that ensure the building is designed, procured, built, and handed over in a responsible manner.
- PLACES: Supports the creation of safe, enjoyable, integrated, and comfortable places.
- HEALTHY: Promotes actions and solutions that improve the physical and mental health of occupants.
- PEOPLE: Encourages solutions that address the social health of the community.
- **RESILIENT**: Encourages solutions that address the capacity of the building to bounce back from short-term shocks and long-term stresses
- **NATURE**: Encourages active connections between people and nature and rewards creating biodiverse green spaces in cities.
- POSITIVE: Encourages a positive contribution to key environmental issues of carbon, water, and the impact
  of materials.

• **LEADERSHIP**: Recognizes projects that set a strategic direction, build a vision for industry, or enhance the industry's capacity to innovate.

The targeting of Green Star is based on NSW Education's Commitment to Sustainability and action to certify projects over \$10 million with new building gross floor area over 1000m² to Green Star Design & As built. Since 2023 the GBCA has not been accepting registrations under the Design and As Built tool, and all registrations have been made using the Buildings v1 tool.

It is also noted that the GBCA is developing a revised version of the tool (version 1.1), the tool is currently being refined by the GBCA and in the consultation phase. It is expected that it will be ready prior to the completion of this project. As appropriate, the school may elect to upgrade their rating from 1.0 to 1.1, or to elect several credits from the revised tool.

#### 5.5 GOVERNMENT ARCHITECT NSW ENVIRONMENTAL DESIGN GUIDE FOR SCHOOLS

The Government Architect NSW (GANSW) released an Environmental Design in Schools Manual which illustrates a set of design principles as guidelines to follow for new development and expansion of schools. The design principles from the GANSW Design Guide for Schools include:

- Context, Built Form and Landscape
- Sustainable, Efficient and Durable
- Accessible and Inclusive
- Health & Safety
- Amenity
- Whole of Life, Flexible and Adaptive
- Aesthetics

#### 5.6 ENVIRONMENTAL PLANNING AND ASSESSMENT REGULATION 2021

Environmental Planning and Assessment Regulation 2021 is a planning tool that captures NSW legislation relating to planning.

#### 5.7 SUSTAINABLE DEVELOPMENT PRACTICE NOTE

The SINSW Sustainable Development Practice Note outlines the framework for the integration of sustainable development principles in the planning, design, tender and construction phases for all School Infrastructure projects. This framework is closely aligned to NSW Government policy positions and the United Nations Sustainable Development Goals.

## **6** SUSTAINABLE DESIGN

The proposed activity aims to go beyond minimum building requirements and provide a progressive sustainability outcome for the community. The sustainability principles adopted for the project will contribute to the conservation of resources and future resilience, across the whole life cycle of the project; from construction, through to the operational phase.

The sustainability initiatives will be verified through a Green Star Buildings v1 Rev C certification, with the activity targeting a 5-Star rating. This Green Star Buildings rating applies to the new classroom building and early learning centre with adjacent open play space and carpark.

This section of the report outlines the initiatives incorporated into the proposed activity in line with the EFSG and Green Star categories and credits. Under each sub-category, the initiatives already incorporated into the design, and additional opportunities identified for further investigation have been outlined. These will be refined through further investigation in design activity.

Refer to Appendix 10.1 for the Green Star Buildings scorecard outlining specific credits proposed for the project.

The Green Star pathway and associated relevant design details will be incorporated into project contract documentation, noting that final pathway is still under development and will be further developed during later design stages. The head contractor will ultimately be responsible for ensuring the Green Star 5-star outcome is achieved.

#### 6.1 RESPONSIBLE

#### 6.1.1 GENERAL PRINCIPLES

Responsible project development principles outline design and construction practices which support the activity and integration of building performances and responsible construction practices. These practices and processes include;

- Guidance from sustainability professionals
- Responsible construction practices
- Commitments to performance (e.g. reducing building and operational waste).
- Pre-commissioning, commissioning and tuning
- Air tightness testing for building performance verification
- Building information to facilitate operator and user understanding
- Metering and monitoring
- Training of construction personnel for sustainable construction practices

#### 6.1.2 PROPOSED INITIATIVES

The following initiatives are currently included in the preliminary sustainability strategy, in order to ensure that the activity minimises its environmental impact through construction and operational management:

- SINSW Commissioning and Temporary Schools Program reviews process to assist in advising, monitoring, and verifying the commissioning and tuning of the nominated building systems throughout the design, tender, construction, commissioning and tuning phases.
- Provision of building information to facilitate operator and user understanding of all building systems, and their specific operation and maintenance requirements and/or environmental targets
- Environmental targets for the activity and a system in place to measure results, for reduction of energy and water consumption.
- Responsible construction practices in place, including development of project-specific best-practice
  environmental management plan (EMP) and high-quality staff support services. Implementation of a
  formalized approach to planning, implementing and auditing during construction to ensure conformance
  with the EMP
- Specialist waste consultant to be engaged to development of an operational waste management plan (OWMP). OWMP principles to be incorporated into the design in future project phases, including separation of waste streams (e.g. paper, cardboard, glass, plastics, toner cartridges, batteries, organics etc.) to facilitate reuse, recycling, composting, and overall waste reduction.
- Public communication and marketing of the activity's sustainability targets and outcomes, to accelerate sustainability in the built environment.

- Waste management plans for demolition, construction and operation of the site. Minimum of 90% of construction and demolition waste to be diverted from landfill.
- Implementation of responsibly manufactured products for internal finishes

#### 6.2 HEALTHY

#### 6.2.1 GENERAL PRINCIPLES

Healthy, comfortable learning environments are vital for students and staff, particularly when they may require spaces that facilitate focus and engagement for a considerable amount of time. General principles include:

- High indoor air quality
- Acoustic comfort with noise levels suitable to the activities within each space
- Good lighting design and control that is suitable to the space and free from glare
- High levels of daylight amenity and views for visual interest
- Reduce harmful exposure to toxins from building materials and finishes
- Thermal comfort

#### 6.2.2 PROPOSED INITIATIVES

The following initiatives are currently included in the preliminary sustainability strategy:

- Passive design principles have been incorporated in the design, including high-performance building envelope, effective shading and building orientation, and natural ventilation openings to support comfortable and low-energy indoor environment quality.
- Acoustic consultant engaged to advise design to support the building's function as training, teaching and multi-purpose spaces for students, staff and community use.
- Best-practice lighting will be provided to improve lighting comfort via flicker-free, high-quality lighting that accuracy addresses the perception of colour within the space.
- High levels of daylight and external views are provided to regularly occupied learning and administration areas, to support high levels of visual comfort for building occupants.. Refer to Preliminary Daylight Assessment undertaken for the activity.
- Internal air pollutants have been reduced via selection of materials with low or no volatile organic compound (VOC) levels and low formaldehyde concentrations, verified via on-site testing.
- Effective heating and cooling to improve thermal comfort, in accordance with EFSG guidelines.

#### 6.3 POSITIVE

#### 6.3.1 GENERAL PRINCIPLES

Through a range of performance measures buildings can; improve their energy efficiency which will reduce Greenhouse Gas emissions from grid-based energy; reduce their potable water demand making them more drought tolerant; and, reduce their embodied carbon through sustainable materials selection. General principles include:

- Selection of materials with low embodied carbon
- Energy efficient buildings
- No fossil fuel use
- Offsetting of residual carbon emissions
- Reducing potable water consumption, such as through the use of high efficiency water fixtures, water harvesting systems and reuse, and water-efficient landscape and irrigation design.
- Installation of a solar PV system capable of generating the new energy consumed by the proposed building.

#### 6.3.2 PROPOSED INITIATIVES

The following initiatives are currently included in the preliminary sustainability strategy, in order to enhance the energy efficiency of the building. Refer to Preliminary Energy Modelling reporting.

- Highly energy efficient building, exceeding the minimum requirements of the NCC Section J. Energy to be undertaken to demonstrate a reduction in energy consumption in comparison to a NCC DtS compliant reference building, in line with the following targets:
  - Minimum 10% reduction, excluding any contribution from renewable energy (e.g. rooftop solar PV) in line with EFSG Section DG02.03 and the Green Star Building Credit 22 Minimum Expectation
  - Minimum 20% reduction, including onsite renewable energy contribution.

Improvement has been demonstrated via energy modelling in schematic design, an update is required at as-built to ensure continued compliance with energy efficiency requirements. Specific energy efficiency provisions include:

- Exceeding the minimum building envelope R-values of NCC Section J
- Improving on the glazing performance requirements of NCC Section J
- Effective shading devices which reduce solar heat gains to conditioned spaces
- Energy-efficient lighting (typically LED) will be provided throughout, exceeding lighting power densities of the NCC Section J
- High efficiency electric domestic hot water systems
- High efficiency heating, ventilation and air conditioning systems with mixed-mode 'traffic light' controls system to reduce operational energy.
- All-electric building services
- New roof mounted solar photovoltaic (PV) system. It is noted that the Greenway Park Primary School works includes provision for a solar PV array,. Currently 47kW is proposed, exact sizing may be refined in future project phases.
- High-efficiency water fixtures.
- Reduction in embodied carbon of materials, achieved through sustainable concrete and steel selection. The building's upfront carbon emissions to be at least 20% less than a business-as-usual reference building, in line with Green Star Credit 21 Credit Achievement.
- Adoption of minimum targets energy efficiency of appliances (air conditioners, TVs, fridges, computers) to
  make energy efficiency one of the selection requirements. Major appliances to be within one star of the
  highest available at the time of purchase.
- Inclusion of a 5kL rainwater tank to reduce potable water consumption, targeting a minimum 45% reduction in potable water consumption

#### 6.4 PLACES

#### 6.4.1 GENERAL PRINCIPLES

Under this category people are placed at the forefront of the design to ensure the building supports health movement, provides enjoyable places and contributes the local community and cultural heritage of the site. General principles include:

- Active transport (walking and cycling) is encouraged, and private vehicle use is reduced
- Communal spaces which support occupant and community engagement are developed
- The local community's cultural heritage embedded in the design

#### 6.4.2 PROPOSED INITIATIVES

The following initiatives are currently included in the preliminary sustainability strategy to improve sustainable transport options:

- To encourage active and public transport, bicycle parking for staff and students as well as changing facilities for staff to be provided to the activity.
- Local heritage of the site reflected through design responses, through meaningful engagement with the local community

#### 6.5 PEOPLE

#### 6.5.1 GENERAL PRINCIPLES

This category recognizes the contributions made by the local workforce which develops the building and aims to ensure sustainable practices support workers during the construction process, for areas including mental health and social inclusion. Additionally, the building design is reviewed for universal design principles for improved accessibility. General principles include:

- The builder supports mental health initiatives and promotes diversity
- The building has Indigenous design aspects, or a Reconciliation Action Plan is developed
- Disadvantaged groups are supported for workforce inclusion
- Universal design principles for people with disabilities are embedded in the design.

#### 6.5.2 PROPOSED INITIATIVES

The following initiatives are currently included in the preliminary sustainability strategy:

- The builder has policies and programs to support construction workers and provides staff support.
- The Head Contractor has procurement practices in place to support disadvantaged groups gain employment opportunities, including:
  - Procurement of all materials and labour will be in accordance with the NSW DoE Aboriginal
     Procurement Policy and NSW DoE Main Works 21 Preliminaries Section 4.4 'Aboriginal Participation'
  - A project-specific Aboriginal Participation Plan will be developed to monitor and report on the minimum Aboriginal participation requirements.
  - At least 2% of the building's total contract value has been directed to generate employment opportunities for disadvantaged and under-represented groups.
- Inclusive design principles are followed to ensure building users with diverse needs have ease of access
  and way finding throughout the building.

#### 6.6 NATURE

#### 6.6.1 GENERAL PRINCIPLES

Impacts to nature are minimised and the biodiversity of the site is fostered through selection of native plant species, this also supports the wellbeing of building and local groups who can maintain a connection with nature through urban green spaces. Waterways are protected through a volume controlled stormwater management strategy. General principles include:

- Protect and enhance ecological and biodiversity value
- Minimise negative impacts, such as lighting pollution and stormwater pollution.

#### 6.6.2 PROPOSED INITIATIVES

The following initiatives are currently included in the preliminary sustainability strategy:

- Specified stormwater pollution reduction targets are met.
- Appropriate lighting design to reduce light pollution, including ensuring an upward Light output Ratio (ULOR) <5% or use of awnings to block light pollution to neighbours and the night sky</li>
- All heat-rejection systems to be waterless to eliminate risk of Legionella (no cooling towers)

## 7 CLIMATE CHANGE RESILIENCE

The projected impacts of climate change on the proposed activity has been assessed, based on predicted climate change models. A Climate Adaptation Workshop was be held with all project stakeholders on 02 Dec 2024. The workshop goals were to:

- Identify and describe risks posed by climate change to the activity and rate the consequences and likelihood of each
- Identify and evaluate the potential adaptation actions and/or design strategies to mitigate those risks which are deemed unacceptable.

To facilitate this process, pre-workshop notes were be provided to all stakeholders attending the workshop which consisted of the following parts:

- Climate change projections
- Consequence scale for the risk assessment
- Likelihood scale for the risk assessment

A climate change risk assessment undertaken as per AS 5334-2013 and Green Star Buildings v1 requirements. Expected impacts from climate change were identified with reference made to both CSIRO projects for the East Coast (South) sub-cluster and NSW Government's NSW and ACT Regional Climate Modelling (NARCLIM) projections. The results showed the following:

- Extreme temperatures are projected to increase with very high confidence, and substantial increases in temperatures reached on hot days, as well as the frequency of hot days.
- Average temperatures will continue to increase in all seasons (very high confidence)
- Generally, less rainfall is expected in winter (medium confidence), but the intensity of extreme rainfall
  events is expected to increase (high confidence)
- Time spent in drought is expected to increase (low confidence) over the course of the century.

The design's responsivity to the above impacts has been assessed in accordance with Green Star requirements, at least two of the risks identified will be addressed by specific design responses, suggested risks to be addressed are detailed within the Climate Adaptation Report.

## 8 NET ZERO AND RESOURCE EFFICIENCY

The proposed activity aims to minimise greenhouse gas emissions, to reflect the NSW government's goal of net zero emission by 2050, and consumption of energy, water and material resources. The key initiatives which have been selected to contribute to these goals are summarised below.

#### 8.1 ENERGY CONSUMPTION AND NET ZERO 2050

The building incorporates the following initiatives into its design:

- Greater than 20% reduction in energy efficiency over minimum NCC compliance
- Passive design including consideration of orientation, thermal mass, shading, and fabric and glazing insulation performance, and colour
- Energy efficient lighting design and control
- Energy efficient heating, ventilation, and air conditioning design and control
- Energy efficient appliances and equipment
- Energy monitoring and passive and active design principles to limit grid reliance during peak demand periods
- Renewable energy sources, including solar photovoltaic panels
- 100% electric design to minimise gas use and greenhouse gas emissions
- Commissioning and tuning strategies

#### 8.2 WATER CONSUMPTION

The building incorporates the following initiatives into its design:

- Water efficient fixtures, equipment, and appliances
- Water use monitoring
- Rainwater collection and water reuse
- Provision of bubblers and taps to encourage water drinking and reduced waste
- Water sensitive urban design
- Stormwater management, and groundwater and drinking water catchment protection
- Commissioning and tuning strategies

#### 8.3 OTHER MATERIALS CONSUMPTION

The building incorporates the following initiatives into its design:

- At minimum 20% reduction in upfront carbon through sustainable material selection, including low embodied carbon materials and high recycled content materials. Including major construction materials – concrete, steel, timber and aluminium
- Building flexibility and built for disassembly

## 9 CONCLUSION

This report identifies the sustainability measures being pursued or investigated by the project team, demonstrating how the relevant sustainability requirements have been addressed.

The proposed design for the activity incorporates sustainability measures that have far reaching benefits from the perspective of energy, water and waste reduction; as well as providing good indoor environment quality, thermal comfort and visual comfort. By this means, the proposed activity will have a positive impact on the health and wellbeing of the students and staff occupying the building.

#### **Mitigation Measures**

Table 1 summarises the mandatory sustainability initiatives required to achieve the 5-star Green Star Buildings v1 certification in line with the proposed sustainability strategy.

TABLE 1 MITIGATION MEASURES

MITIGATION NAME	MITIGATION MEASURE	REASON FOR MITIGATION MEASURE
Green Star Mandatory Requirements	All mandatory items required by the Green Star Buildings v1 guidelines. Refer to 10.2	Achievement of mandatory items is non-negotiable when targeting a formal Green Star rating.
Educational Facilities Standards and Guidelines ESD Schedules	Achievement of all ESD initiatives required by the EFSG. Refer to 10.1	EFSG ESD requirements

## 10 APPENDICES

## 10.2 GREEN STAR BUILDINGS V1 PATHWAY

Refer to the following page(s).

SINSW 5-Star - Greenway Park 20/01/2025 - Schematic Design

Targeted Performance Level Minimum Expectation Credit Achievement Exceptional Total Points Available Under Moderate Risk High Risk P Comments EFSG Reference: DG2.01 - Scope EFSG Reference: DG2.09 - Sustainability Benchmarking Auct details of compliance Financial sparency disclosure to be confirmed by SINSW in future phases. 1 Industry Development Credit Achievement: The building owner or developer appoints a Green Star Accredited Professional. The building owner or developer discloses the cost of sustainable building practices to the GBCA. The building owner or developer discloses the cost of sustainable building practices to the GBCA. or developer markets the building's sustainability achievements.

EFSG Reference: DG02.07.1 - Construction and Demolition Waste Minimum Expectation: Environmental management system; environmental management plan; 80% of diverted from landfill; training to construction personnel. Credit Achievement: 90% of CAD waste diverted from landfill; waste contractors and facilities comply w 2 Responsible Construction Credit Acnievement: 90 76 01 Cold Wasse directed inch said Green Star criteria. EFSG Reference: DG20.03 - Air Tightness GBCA Technical Question Reference: Request R-14422 Noted that tuning is not done by SINSW's commissioning team. Will need to be provided by a 3rd party. Minimum Expectation: Metering and monitoring systems; environmental performance targets; designed and tested for airtightness; commissioning; tuning; operations and maintenance information; building users guide. Credit Abrievement: Independent Commissioning Agent is engaged. As per Request R1-1422, the SNSW "Commissioning and Temporary Schools Program Team" can be used in lieu of engaging a dedicated independent source of the commissioning and temporary Schools Program Team" can be used in lieu of engaging a dedicated independent source of the commissioning and temporary Schools Program Team" can be used in lieu of engaging a dedicated independent source of the commissioning and temporary Schools Program Team". 3 Verification and Handove EFSG Reference: DG02.07.1 - Operational Waste Noted by RPI that qualified waste management Minimum Expectation: Separate collection of landfill, comingled recyclables, and one other (soft plastic or compostable organics). Size of waste storage area and access to waste storage area (by both occupants and w contractors) signed off by a specialist waste consultant or contractor. professional will be engaged to confirm requirements met 5 Responsible Procuremen Credit Achievement: At least 50% of all structural components (by cost) meet a Responsible Products Value of at least 10. The structure is defined as load bearing and stability components of a building, including steel, timber, concrete load bearing elements. Credit Achievement: The project must have 40% of all internal building finishes (by cost) meet a Responsible Products Value of at least 7. Internal finishes include flooring, plasterboard, paints, ceilings, partitions, doors, internal windows or similar. Johrey used as part of a wall finish may also be counted. Sealants and Adhesives used for finishes are also included. Losse furniture is excluded. 9 Responsible Finishes 1 2 1 7 Minimum Expectation: Air intake and exhaust separation to meet ASHRAE 62.1; outside air 50% higher than AS1688.2 or 700ppm CO<sub>2</sub> DCV; ductwork cleaning before operation. • 2 . 10 Clean Air 2 EFSG Reference: DG12 - Natural Light & DG63 - Lighting Minimum Expectation: High quality artificial lighting and glare reduction. Note the CRI requirements for Green Star buildings exceed the requirements of the EFSG. Credit Achievement-Project to salkly the daylight requirements for high levels of natural daylight in 40% occupied areas. External glare to be controlled. Exceptional Performance: Project to salkly increased artificial lighting requirements. Including "avoiding excessive lighting or overly uniform solutions." Daylight modelling demonstrates complete easily achieved for the proposed detection. 11 Light Quality 2 GBCA Technical Question Reference: Request R-14412 EFSG Reference: DG02.05 - Sustainable Materials Minimum Expectation: Low VOC and low formaldehyde materials.

Credit Achievement: On-site tests verify the building has low Volatile Organic Compounds (VOC) and formaldehyde levels. 13 Exposure to Toxins . 2 Requires on-site testing Amenity and Comfort Credit Achievement: The building provides high quality views, and interaction with nature (5% of the building's regularly occupied areas must be planted, that regular occupants can interact with). 15 Connection to Nature 2 4 EFSG Reference: DG02.08 - Climate Change Adaptation Climate Change workshop complete tcomes of CCR report must be addre through future design phases Minimum Expectation: Climate change pre-screening checklist. This is undertaken by NDY in Pha-Credit Achievement: Project-specific climate change risk and adaptation assessment undertaken I consultant. Workshop will be provided by NDY in Phase 2, with final report issued in Phase 3. EFSG Reference: DG20.03 - Design / Detailing High-SRI roofing to be installed (e.g. Colorbond Surfmist) 1 Credit Achievement: Minimum 75% of the site comprises elements that reduce the heat impact Landscaping, new roofing materials to be kept light in colour, or shaded by trees or solar panels 1. Achievement: The building overall peak demand is reduced by 10%. This can be achieved with on or a nation of, Active Generation and Storage Systems, Demand Response, Passive Design Solutions. 20 Grid Resilience 3 3 2 Total EFSG Reference: DG02.05 - Sustainable Product EFSG Reference: DG2.5.1 - Chain of Custody EFSG Reference: DG21.02 - Concrete EFSG Reference: DG21.05 - Sustainable Timber NDY Embodied Carbon Assesment identific the required design/material substitutionss needed to achieve the required 20% embodi carbon reductions. This will need to be captu in detailed design. 21 Upfront Carbon Emissions Minimum Expectation: Building upfront carbon emissions reduced by 10%, necessitating comprehensive push for lower carbon civil, architectural and structural materials. <u>Credit Achievement: Building upfront carbon emissions reduced by 20%</u> EFSG Reference: DG02.03 - Energy Conservation um Expectation: Building operational energy reduced by 10%, via high performance building fabric and Milliflamm Experience. Moreography operational energy reduced by 20%. Will require comprehensive push for high performance building tablic (i.e. insulation, glazing performance, air-lightness & reduced thermal bridging) and energy-efficiency systems (HVAC, LED lighting, controls systems) and on-site renewable energy generation (sol achievable, confirmed via energy modelling.

Modelling to be updated in future design phas
to ensure continued compliance. PV). GBCA Technical Question Reference: Request R-16910 ZCAP is not required since the building is all electric.
The NSW Government is responsible for n: Zero Carbon Action Plan to be deve Credit Achievement: All electricity under the control of the building owner must be sourced from renewables. The renewable energy contract length must be at least 5 years. Exceptional Performance: As per Credit Achievement since Education buildings do not have a delineation electricity across its entire portfolio. Their procurement approach is due to be updated. Credit feasibility to be updated once details are revealed. 23 Energy Sc Exceptional Performance. As place of collection and collection and collection of collection and tennals. Credit Achievement: All refigerants in the new buildings must be either eliminated OR offset as below. Eliminating Refigerants: Use of refigerants with a GWP of 10 or less Offsetting Refigerants: 100% of carbon emissions from refrigerants must be offset. 2 EFSG Reference: DG02.04 - Water Conservation 5kL RW tank allows for targeting of Credit Achievement. Water to serve landscape irrigation and toilet flushing. Minimum Expectation: High efficiency fitting and fixtures
Credit Achievement: The building uses 45% less potable water compared to a reference building.
Exceptional Performance: The building uses 75% less potable water compared to a reference building. The latest GS Buildings tool has applied weightings to the LCA impacts which we note as being very challenging to achieve. (focus has shifted from just carbon) EFSG Reference: DG01.03 - Life Cycle Assessment 2 2 26 Life Cycle Impacts The project demonstrates a 30% reduction in life cycle impacts when compared to standard practice.

## 10.3 PRELIMINARY DAYLIGHT MODELLING ASSESSMENT

Refer over.

## **CONSULTANT ADVICE NOTICE**

PROJECT: SINSW - GREENWAY PARK PUBLIC SCHOOL UPGRADE CAN NO: G-001[1.0]

Date: 18 December 2024 Project No: 41153 - 001 Pages: 5

#### SUSTAINABILITY - DAYLIGHT MODELLING ASSESSMENT

#### **Executive Summary**

This advice provides the preliminary daylight modelling assessment for the proposed Greenway Park Public School Upgrade. The aim of the assessment is to determine compliance with the EFSG Access to Daylight requirements and Green Star Buildings v1 Credit 11 Light Quality – Access to Daylight.

The modelling results show that across all levels **52.9%** of primary areas are deemed compliant, which exceeds considerably the 40% required by the EFSG and Green Star daylight requirements.

TABLE 1 - SURFACE PROPERTIES REQUIRED FOR COMPLIANCE

SURFACE	PROPERTIES	COMMENTS
Ceiling	Surface reflectance: 70% White plasterboard or si	
Floor	Surface reflectance: 30% Dark grey carpet/tile	
Wall	Surface reflectance 60%	White plasterboard or similar
External Glazing	VLT: 40%	System values
Internal glazing	VLT: 40%	System Values

#### Information Sources

The assessment is based on the following:

- EFSG (Education Facilities Standard and Guidelines) v2.0
- Architectural information:
  - o Fulton Trotter architectural drawing set REV 06 (18/10/2024)

#### **Project Requirements**

This project is being assessed against the daylight requirements of the SINSW EFSG Access to Daylight.

#### **EFGS Daylight**

The EFSG requires that at least 40% of functional and occupied spaces achieve daylight illuminance. This is defined as having at least 160 lux for 80% of core hours. This is equivalent to the Green Star Buildings Credit 11 requirements.

#### Green Star Buildings Credit 11 - Daylight

Up to 2 points are available where a percentage of the nominated area receives high levels of daylight:

- For 40% of the nominated area – 2 points

For this assessment, compliance is demonstrated using the daylight autonomy compliance pathway, and "high levels of daylight" are deemed to have at least 160 lux due to daylight during 80% of the nominated hours.

#### **Input Parameters**

Refer to Figure 1 below for a representation of the model geometry used in this assessment.

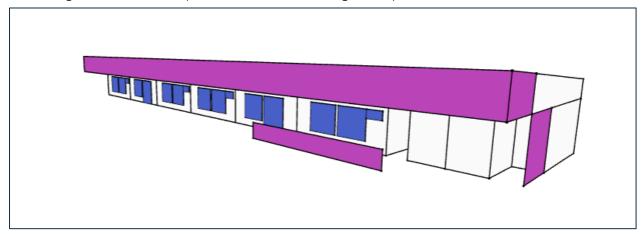

FIGURE 1 - MODEL REPRESENTATION OF GREENWAY PARK PUBLIC SCHOOL

Table 2 and Table 3 summarises the input parameters used in the daylight model. Glazing visual light transmittance (VLT) values are the minimum values which must be met in order achieve the credit, opaque surface reflectance values are based on commonly used surface finishes.

TABLE 2 - OPAQUE SURFACE REFLECTANCE

SURFACE	REFLECTANCE	COMMENTS
Ceiling	70%	White plasterboard or similar
Floor	30%	Grey carpet/tile
Wall	60%	White plasterboard or similar

TABLE 3 - GLAZING VLT

AREA	VISUAL LIGHT TRANSMITTANCE (VLT)	COMMENTS
External glazing	VLT: 40%*	System values
Internal glazing	VLT: 40%*	System values

<sup>\*</sup> Based on minimum VLT indicated in Patternbook, it is expected that the final VLTs will be higher, which will only further improve the result

For this assessment, nominated hours are taken as 08:00 to 16:00 on weekdays, based on the Green Star Energy Consumption and Greenhouse Gas Emissions Calculation Guide school profiles.

#### **Results**

The portion of area complying with the Credit 11 requirements are summarised in TABLE 4 as below.

TABLE 4 - SUMMARY OF DAYLIGHT ASSESSMENT RESULTS

BUILDING	COMPLIANCE PERCENTAGE
Greenway Park Ground Level	52.9%
TOTAL (AREA WEIGHTED)	52.9%

The distribution of areas by hours of daylight autonomy is summarised in Figure 2 as below.

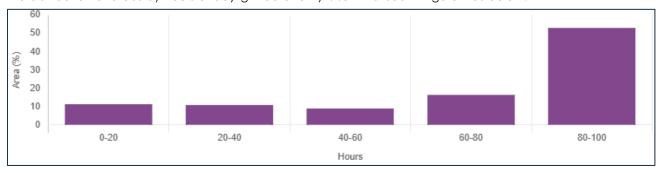

FIGURE 2 - DAYLIGHT AUTONOMY - HOURS OF AUTONOMY DISTRIBUTION

#### Conclusion

The preliminary modelling results indicate that Greenway Park Public School will comfortably meet the daylight requirements of the EFSG. The result is compliant by a considerable margin, and is based on conservative assumptions. Over the course of detailed design these assumptions will be further clarified, and is expected to only improve the result.

These daylight requirements are met provided the development uses or exceeds the VLT and surface properties listed in this advice and satisfies the external glare control requirements.

NDY, A Tetra Tech Company

Richard Burton | Engineer | Sustainability

r.burton@ndy.com

## **APPENDIX A: DAYLIGHT CONTOUR - THRESHOLD PLOTS**

Refer to the figures below for a visual representation of the daylight results for all spaces included in the assessment, with compliant areas shown in yellow. Areas with no access to glazing are not modelled and automatically result in a 0% compliant area. Only areas included in the nominated area are modelled.

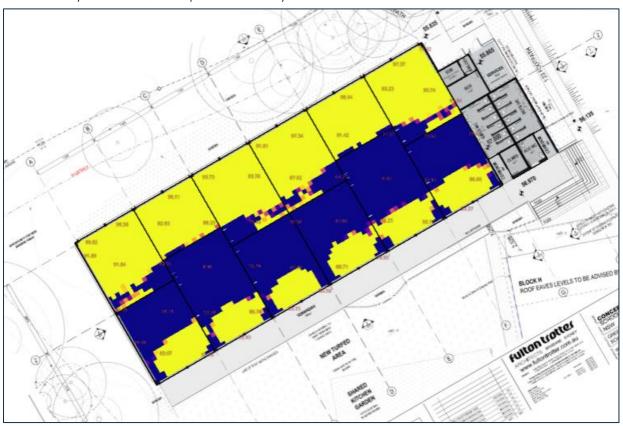

FIGURE 3 - THRESHOLD PLOT

## **APPENDIX B: DAYLIGHT SIMULATION REPORT**

Refer to the following pages.

## **Daylight Simulation Report**

Project	Greenway Park Public School GLS Daylight Geometry
Address	Wyattville Dr, West Hoxton NSW 2171, Australia (33.94° S, 150.84° E)
Date	2024-12-13, 03:48 PM
Author	r.burton@ndy.com
Scope	National Construction Code 2022

#### **Using Speckel**

Speckel provides various daylight calculations to satisfy the requirements of your local construction code. Radiance 5.3 (Validated against CIE171:2006) has been used to simulate the building with wall, roof, floor, window, and shading surfaces according to user inputs. A grid of sensor points have been generated in the appropriate zones accordance with user inputs. Each metric result includes a summary compared to required outcomes, a level-by-level visualisation of results, and zone-by-zone reporting.

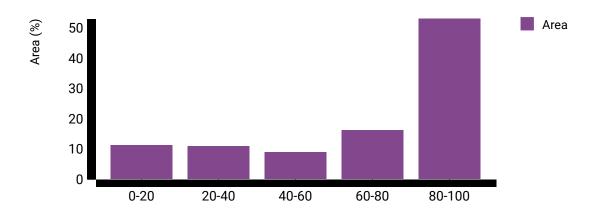

## **Results**

#### Spatial Daylight Autonomy

To meet the acceptance criteria, 40 % of total area across the assessed zones must meet the conditions:

- greater than 160.0 lux
- for at least 2920 (80 %) of the simulated hours
- between the hours of 8 am until 6 pm
- on all days

A total of 3398 sensor points representing an area of 811.27 m<sup>2</sup> across 12 zones were assessed, where an area of **52.91** % achieved the conditions, **meeting** the acceptance criteria.

#### **EXECUTIVE SUMMARY**

NDY were commissioned to develop a Climate Change Adaptation Plan for Greenway Park Public School with the intent of achieving 1 point for Credit 16 Climate Change Resilience (Credit Achievement).

This assessment was undertaken during the developed design stage of the project to assess the effectiveness of adaptation measures that had already been incorporated, as well as identifying any additional risks that need consideration. Consequently, the assessment has allowed the identification of additional adaptation measures required for implementation, specifically focusing on hazards defined as "High" or "Extreme" risk.

The analysis has assessed the site's climatic conditions using one climate change scenario (RCP8.5) for two-time scales relevant to the project's lifespan, which in this case included 2050 (~25 years post-practical completion) and 2090 (65 years from occupation, noting the expected building life before major refurbishments is ~50-years).

#### Climate Projections and Assessed Risks

Projections in this report were based on outputs from global climate models (GCMs) with data provided by CSIRO's Climate Change in Australia's database relevant to Sydney. The results showed the following (CSIRO Climate Change Projections, East Coast Cluster Report 2015):

- Extreme temperatures are projected to increase with very high confidence, along with substantial increases in temperatures reached on hot days, the frequency of hot days, and the duration of warm spells.
- Projected mean, maximum and minimum temperatures will continue to increase in all seasons (very high confidence).
- Decreases in winter and spring rainfall is projected (high confidence), however summer and autumn rainfall is expected to increase with less confidence due to natural climate variability (main driver of rainfall changes).
- The intensity of extreme rainfall events is projected to increase (high confidence).
- There is high confidence that climate change will result in a harsher fire-weather climate in the future.
- Time spent in drought is projected to increase (low confidence) over the course of the century.

Table 1 below shows the number of risks identified before and after adaptation measures (both in terms of alternative design solutions and operational) were considered for the project.

TABLE 1: SUMMARY OF INITIAL AND REASSESSED RISKS

RISK RATING	YEAR	LOW	MEDIUM	HIGH	EXTREME	TOTAL
Business as Usual:  Number of risks when considering business as usual design measures	2040	5	9	3	0	17
	2075	4	10	3	0	17
Residual Risks: Number of risks	2040	7	10	0	0	17
following adaptation measures	2075	7	10	0	0	17

## 1 INTRODUCTION

#### 1.1 CLIMATE CHANGE RISK ASSESSMENT OVERVIEW

NDY, A Tetratech Company, were commissioned to undertake a climate change risk assessment for Greenway Park Public School in line with current predictions to determine the hazards and risks associated with future climatic conditions, and how these are likely to affect this precinct into the future.

This report details the methodologies and outcomes of the climate change risk assessment, which was performed during the design phase and used to inform the sustainability strategy for the project.

The climate change risk assessment used scientific projections to inform the identification of hazards and respective risks specific to the site. The assessment was developed in accordance with AS 5334-2013 Climate Change Adaptation for Settlements and Infrastructure, with reference made to the Australian Government guideline document Climate Change Impacts & Risk Management: A Guide for Business and Government (2006).

The risk assessment is detailed in Section 4 of this report and is broken into a description of the predicted climate scenarios and effects (temperature, increases in rainfall, evaporation, and flooding likelihoods), understanding how these climate change conditions are likely to impact the building, its users and surrounding community into the future, and identifying the project responses to adapt to these risks. These responses are the basis of the Climate Adaptation and Resilience Plan, with the aim to assign responsible parties and actionable design items to be incorporated throughout the design, tender, construction and operational processes, as applicable.

## 1.2 DEVELOPMENT DESCRIPTION

#### 1.2.1 SITE

The two building 1,550 m<sup>2</sup> extension to Greenway Park Public School is located at Wyattville Dr, Carnes Hill, NSW, 2217. The extension will be comprised of:

- Teaching spaces
- Internal walkways
- Bathrooms
- External staircases
- Concrete structure.

The project's sustainability commitments include achieving a 5-star Green Star Buildings rating.

#### 1.2.2 LOCATION

The CSIRO and Australian Bureau of Meteorology's "Climate Change in Australia" climate projections are categorised within natural resource management (NRM) regions that are defined by catchments and bioregions. Greenway Park Public School falls within the East Coast cluster (refer to Figure 1 below).

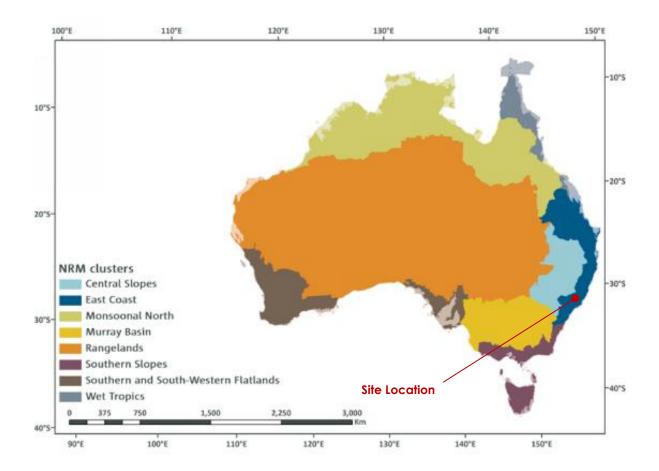

FIGURE 1: SITE LOCATION WITHIN THE NRM CLUSTERS (EAST COAST)

#### 1.2.3 CLIMATIC CHARACTERISTICS

The East Coast cluster is defined as sub-tropical, with tropical and temperate influences. In terms of climate types, the cluster includes tropical regions in the north and temperate regions in the south, both with warm summers. Furthermore, at higher elevations summers are mild. Generally, summers are warm and winters are mild, with a small temperature gradient between the warm inland of NSW and further to the south and east (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

## 2 CONTEXT ESTABLISHMENT

#### 2.1 SCOPE & PURPOSE

This Climate Change Adaptation Plan has been developed in accordance with AS 5334-2013 Climate Change Adaptation for Settlements and Infrastructure with the intent of achieving 1 point for Credit 16 Climate Change Resilience within the Green Star Buildings v1 rating tool. This assessment was undertaken during the developed design stage of the project to assess the effectiveness of adaptation measures that had already been incorporated, as well as identifying any additional risks that need consideration. Consequently, the assessment has allowed the identification of additional adaptation measures required for implementation, specifically focusing on hazards defined as "High" or "Extreme" risk.

The process for the assessment had the following key steps:

- 1. Workshop facilitated by NDY for key project stakeholders to identify key issues and discuss climate change projections identified for the site and relevant to the development
  - a. Define the relevant climate variables with the design and construction team;
  - Map out the direct and indirect effects of a changing climate on the proposed building design;
- 2. Evaluate the level of risk of each climate hazard based on likelihood of occurrence and consequence of effect;
- 3. Identify potential adaptation and mitigation measures to reduce the level of risk, focussing on those risks deemed unacceptable to building owners and end users;
- 4. Allocate responsibilities of implementing the adaptation measures, either by integrating the strategy in to the design of the building itself, or by engaging with the building owner and/or operator.

## 2.2 SUITABLY QUALIFIED PROFESSIONAL UNDERTAKING ASSESSMENT

This Climate Change Adaptation Plan has been developed by a team of experienced sustainability consultants, including Sanjeev Ganda (Senior Sustainability Consultant) and reviewed by Dana Jump (Senior Sustainability Consultant). Detailed CVs are provided in Appendix A.

Sanjeev has a formal tertiary qualification in Sustainability from Victoria University of Wellington (Master of Building Science) and is also a qualified Green Star Accredited Professional (GSAP). Sanjeev has experience in Climate Adaptation Plans, including for residential, healthcare, offices, retail, and education facilities.

Dana Jump has a formal tertiary qualification in Sustainability from Edith Cowan University (Bachelor of Science in Environmental Management) and is a qualified Green Star Accredited Professional (GSAP) and Infrastructure Sustainability Accredited Professional (ISAP) Dana has over three years of experience delivering Climate Risk assessments and implementing Climate Adaptation Plans for different project types, including infrastructure, retail and commercial.

#### 2.3 KEY OBJECTIVES

Success criteria for future-proofing the office building against climate change impacts included the following, as per the Department of the Environment and Heritage Australian Greenhouse Office (AGO) Climate Change Impacts and Risk Management: A Guide for Business and Government (2006):

- Public Safety Maintaining public safety;
- Local Economy and Growth Protecting and enhancing local business;
- Community and Lifestyle Protecting the existing lifestyle enjoyed by the local community and visitors;
- Environment and Sustainability Protecting environmental amenity;
- Administration Ensuring sound public administration and governance.

## 2.4 DESIGN LIFE OF ASSET

It is important to select a timeline relevant to the design life of the infrastructure components and one that is appropriate to cover the asset investment horizon, such as leasing tenure. This will affect the climate projections

used, the level of climate risk the asset may potentially be exposed to and the resulting climate adaptation response. The office building has been designed to last for 50-60 years before major refurbishment.

TABLE 2: DESIGN LIFE OF ASSET ELEMENTS

ASSET TYPE	DESIGN LIFESPAN (YEARS)
Structure	50
Drainage (Civil and Hydraulic)	50
Building Pavement (Civil and Hydraulic)	50
Critical infrastructure systems – security & communications	25
HVAC	15
Façade	30
Materials and Finishes (Architectural elements)	30

#### 2.5 CLIMATE CHANGE CONTEXT/SCENARIOS

#### 2.5.1 GREENHOUSE GAS EMISSIONS SCENARIOS

Although future emissions growth is complex and uncertain, the Intergovernmental Panel on Climate Change (IPCC) has developed a range of potential future greenhouse gas emissions scenarios to address this uncertainty and represent a plausible set of future economic and social conditions on which emission levels were generated (Australian Government Department of Climate Change, 2009).

As per guidance in the AGO's Guide, specifically Section B4.1, a limited number of scenarios covering the most plausible future climate change impacts were used in this analysis to gain a holistic picture of predicted climate change impacts for this site.

The Representative Concentration Pathway (RCP) 8.5 IPCC climate change scenario was used in this impact assessment. This scenario reflects the global climate model (GCM) simulations and was selected as it represents a high-emission scenario and therefore allows the potential worst-case impacts to be assessed. The 6th Report by IPCC (AR6) was released in March 2023 and states: 'some future changes are unavoidable and/or irreversible but can be limited by deep, rapid and sustained global greenhouse gas emissions reduction'. The findings of this latest science confirm that the global trends align with this worst-case scenario.

#### Representative Concentration Pathway 8.5 (RCP8.5)

This scenario is representative of a high-emission scenario, for which the carbon dioxide concentration reaches about 940 ppm by the end of the 21st century and assumes that global annual GHG emissions (CO2-e) continue to rise through to 2100 **Invalid source specified.** This scenario represents 'business as usual' and combines assumptions regarding the absence of climate change policies with higher world populations and modest rates of technological change or energy intensity improvements which culminate in higher energy demands and therefore greenhouse gas emissions increasing year on year.

#### 2.5.2 FUTURE TIME SCALES

In accordance with best practice and Green Star guidelines, NDY have assessed the site's climatic conditions for the following two relevant timescales:

- 2050, approximately 25 years post-practical completion;
- 2090, approximately 65 years following occupation, noting the expected building life before a major refurbishment is 50-60 years.

#### 2.5.3 CLIMATE VARIABLES

Based on the site's location, vulnerabilities, and the explicit requirements of Green Star Buildings v1.0, the following climate variables have been considered:

#### **Primary Effects**

Temperature	Rainfall
Average Annual Temperature	Average Annual Rainfall
Extreme Temperature Events	Extreme Rainfall Events
Relative Humidity	Solar Radiation
Average Humidity	Average Solar Radiation
Sea	Drought
Sea Level Rise	Periods of Drought
Secondary Effects	
Wind	Hail
Extreme Wind	Hail size
Lightning	Bushfire
Frequency and location	Dust Storm

#### 2.5.4 STANDARDS

In addition to AS 5334-2013, ISO 31000 – Risk Management (Standards Australia, 2009) and the AGO Guide, "Climate Change Risks and Impacts: A Guide for Government and Business", were used to establish the context for this assessment. Prior to the stakeholder workshop, these documents were referenced to ensure that all relevant risks were identified, analysed and evaluated, allowing the design team and project stakeholders to focus on proposing initiatives and strategies during the workshop itself.

## 2.6 RISK CRITERIA

The following tables define the risk likelihood, consequence and overall priority rating for each of the hazards assessed. All have been taken from or adapted from AS 5334-2013.

TABLE 3: RISK ASSESSMENT LIKELIHOOD SCALE

RATING	DESCRIPTOR	RECURRENT OR SINGLE EVENT RISKS	LONG TERM RISKS
Almost Certain	Could occur several times per year	Has happened several times in the past year and in each of the previous 5 years or Could occur several times per year	Has a greater than 90% chance of occurring in the identified time period if the risk is not mitigated
Likely	May arise about once per year	Has happened at least once in the past year and in each of the previous 5 years or May arise about once per year	Has a 60-90% chance of occurring in the identified time period if the risk is not mitigated
Possible	May arise a couple of times in a generation	Has happened during the past 5 years but not in every year or May arise once in 25 years	Has a 40-60% chance of occurring in the identified time period if the risk is not mitigated
Unlikely	May arise once in a generation	May have occurred once in the last 5 years or May arise once in 25 to 50 years	Has a 10-30% chance of occurring in the future if the risk is not mitigated
Rare	May arise once in a lifetime	Has not occurred in the past 5 years or Unlikely during the next 50 years	May occur in exceptional circumstances, i.e. less than 10% chance of occurring in the identified time period if the risk is not mitigated

TABLE 4: RISK ASSESSMENT CONSEQUENCE SCALE

DESCRIPTOR	ENVIRONMENTAL	SOCIAL/CULTURAL	FINANCIAL
Insignificant	No adverse effects on natural.	No adverse human health effects.	Little financial loss or increase in operating expenses.
Minor	Minimal effects on the natural environment.	Short-term disruption to employees, customers or neighbours. Slight adverse human health effects or general amenity issues.	Additional operational costs. Financial loss is small <10%.
Moderate	Some damage to the environment, including local ecosystems. Some remedial action may be required.	Frequent disruptions to employees, customers or neighbours. Adverse human health effects.	Moderate financial loss 10-50%.
Major	Significant effect on the environment and local ecosystems. Remedial action likely to be required.	Permanent physical injuries and fatalities may occur. Severe disruptions to employees, customers or neighbours.	Major financial loss 50-90%.
Catastrophic	Very significant loss to the environment. May include localized loss of species, habitats or ecosystems. Extensive remedial action essential to prevent further degradation. Restoration likely to be required.	Severe adverse human health effects, leading to multiple events of total disability or fatalities. Total disruptions to employees, customers or neighbours. Emergency response at a major level.	Extreme financial loss >90%.

TABLE 5: PRIORITY MATRIX

		LIKELIHOOD				
		Rare	Unlikely	Possible	Likely	Almost Certain
	Catastrophic	Low	Medium	High	Extreme	Extreme
NCE	Major	Low	Medium	Medium	High	Extreme
CONSEQUENCE	Moderate	Low	Low	Medium	High	Extreme
CON	Minor	Low	Low	Medium	Medium	High
	Insignificant	Low	Low	Low	Medium	Medium

## 3 CLIMATE CHANGE PROJECTIONS FOR EAST COAST

The following climate change projections have been assigned a confidence rating which follows IPCC likelihood terminology. The IPCC uses the following terminology for certainty/likelihood of outcomes.

The confidence rating does not equate to a probabilistic confidence, rather it covers the type, amount, quality, and consistency of evidence, and the extent of agreement (CSIRO Climate Change Projections, East Coast Cluster Report 2015). The following terminology for certainty/likelihood of outcomes are used in this report:

- Low confidence
- Medium confidence
- High confidence
- Very high confidence

It is important to understand that climate change is not expected to be linear or smooth. It is anticipated that climate change will be characterised by extreme events that are hard to predict and even harder to manage and as a result many ecosystems, both natural and man-made, will find it difficult to adapt (IPCC, IPCC WGI AR5 Climate Change 2013: The Physical Science Basis, 2013).

#### 3.1 TEMPERATURE

#### 3.1.1 HIGHER TEMPERATURES

Continued increases in mean, daily maximum and daily minimum temperatures are projected for the East Coast cluster with very high confidence with the near future (2030) projected increase of mean annual temperature around 0.6 to 1.3 °C above the climate of 1986–2005, with only minor differences between RCPs (CSIRO Climate Change Projections, East Coast Cluster Report 2015). Late in the century (2090), there is a large difference between scenarios, with projected warming of 2.7 to 4.5 °C for RCP8.5 (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

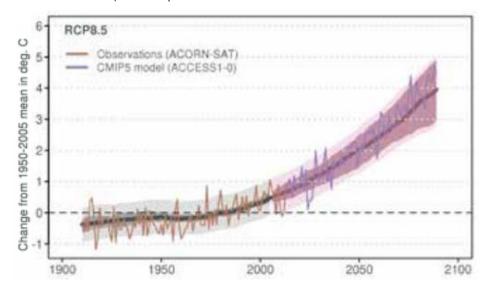

FIGURE 2: EAST COAST ANNUAL AVERAGE SURFACE AIR TEMPERATURE (°C) FOR 1910–2090 (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

TABLE 6: AVERAGE MAXIMUM SEASONAL TEMPERATURE (BUREAU OF METEOROLOGY, HORSLEY PARK EQUESTRIAN CENTRE STATION NO. 067119) AND FUTURE PROJECTIONS (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

Season	Baseline	2050 @ RCP8.5	2090 @ RCP8.5
Summer	27.3° C	28.6° C	31.8° C
Summer	27.5°C	(+1.3° C)	(+4.5° C)
A 1	22.28.0	23.5° C	26.8° C
Autumn	22.2° C	(+1.3° C)	(+4.6° C)
Winter	17.00 €	18.0° C	21.7° C
	16.8° C	(+1.2° C)	(+4.9° C)
Spring	22.5%	24.0° C	27.8° C
	22.5° C	(+1.5° C)	(+5.3° C)

#### 3.1.2 HOTTER AND MORE FREQUENT HOT DAYS, FEWER FROSTS

A substantial increase in the temperature reached on the hottest days, the frequency of hot days and the duration of warm spells are projected with very high confidence and as a result, an expected decrease in the frequency of frost-risk days is projected with high confidence (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

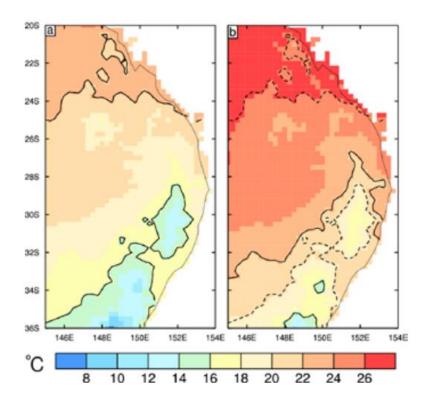

FIGURE 3: ANNUAL MEAN SURFACE AIR TEMPERATURE (°C), FOR THE PRESENT CLIMATE (A), AND MEDIAN WARMING UNDER RCP8.5 FOR 2090 (B) (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

TABLE 7: AVERAGE ANNUAL NUMBER OF DAYS ABOVE 35°C AND 40°C (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

THRESHOLD	CURRENT	2050 @ RCP8.5	2090 @ RCP8.5
Over 35 °C	14.6 days	5 days (-9.6 days)	1 <b>5 days</b> (+0.4 days)
Over 40 °C	2.3 days	0.8 days (-1.5 days)	3.3 days (+1 days)

The risk of line outages, blackouts, and asset failures is likely to increaseInvalid source specified.. This is due to increases in peak demand from increased air-conditioning use exceeding baseload increases. Although the main drivers for energy consumption are demographic and socio-economic factors, climatic conditions are also linked to average and peak energy demands. Invalid source specified..

Higher rates of infectious and water-borne disease, as well as increased rates of heat-related stress and mortality, particularly among the aged and vulnerable populations, are likely outcomes (Grose et. al, 2015).

The frequency of hot days and the frequency of high fire risk weather is likely to increase. Greenway Park, within the East Coast cluster, currently experiences temperatures above 35°C, on average, 14.6 days per year. Studies have highlighted that by 2090 this is predicted to decrease under RCP8.5, and the number of days over 40°C decreases to 3.3 days (CSIRO Climate Change Projections, East Coast Cluster Report 2015). This has important ramifications for air pollution and health, with ozone pollution events linked to the frequency of hot, sunny days and with the highest particle pollution concentrations linked to the presence of bushfire smoke (Grose et. al, 2015).

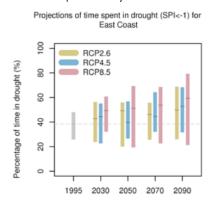

#### 3.1.3 HEATWAVES

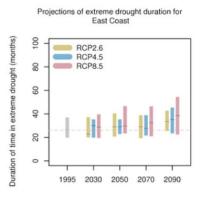

The frequency of heatwave events is predicted to increase over time, which will cause further challenges to the school operations. As such multiple risks relating to extreme temperature have been identified. Refer to Appendix D. Risk Register, and has necessitated many mitigations in the schools design and operations.

#### 3.2 PRECIPITATION

#### 3.2.1 EXTENDED DROUGHT PERIODS

There is medium confidence that the time spent in drought and extreme drought frequency will increase over the course of the 21st century in line with projected declines in annual and cool season rainfall, but low confidence in projecting the duration of extreme droughts (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

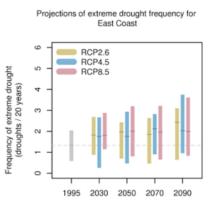

FIGURE 4: TIME IN DROUGHT (LEFT), DURATION OF EXTREME DROUGHT (MIDDLE), AND FREQUENCY OF EXTREME DROUGHT (RIGHT) (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

#### 3.2.2 EXTREME RAINFALL EVENTS

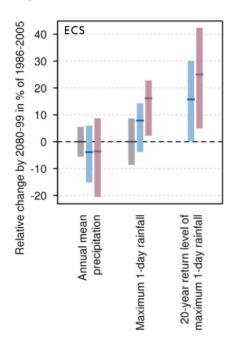

FIGURE 5: PROJECTED CHANGES IN MEAN RAINFALL, MAGNITUDE OF ANNUAL MAXIMUM 1-DAY RAINFALL, AND MAGNITUDE OF 1 IN 20-YEAR RAINFALL EVENTS FOR 2090 (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

There is high confidence that whilst the intensity of heavy rainfall extremes will increase, the magnitude of change cannot be reliably projected (CSIRO Climate Change Projections, East Coast Cluster Report 2015). The trend of annual mean rainfall is unclear and tending toward decrease whilst increased magnitudes of extreme rainfall events are projected. Separated into cool and warm seasons, the latter being the season where the largest annual daily totals are currently being observed, the increase in 1-day rainfall is larger in the warm season. The magnitude of the anticipated extremes of rainfall are highly dependent on the emission scenario and the future time period.

#### 3.2.3 AVERAGE RAINFALL

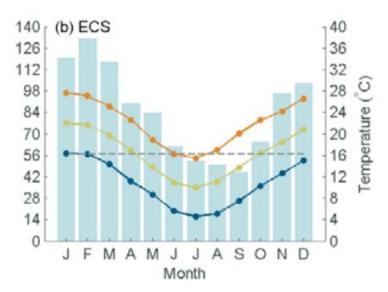

FIGURE 6: MONTHLY RAINFALL AND TEMPERATURE CHARACTERISTICS FOR THE EAST COAST CLUSTER (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

The East Coast cluster experienced prolonged periods of extensive drying in the early 20th century and again by the end of the century. In the latter, drying occurred primarily during the cool season. Overall, there is no long-term trend in annual rainfall throughout the 20th century and this will extend with high confidence into the near term (2030). Long-term trends indicate there is high confidence that cool season rainfall will continue to decline and there is medium confidence that rainfall will remain unchanged in the warm season (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

TABLE 8: AVERAGE RAINFALL (BUREAU OF METEOROLOGY, HORSLEY PARK EQUESTRIAN CENTRE STATION NO. 067119) AND FUTURE PROJECTIONS (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

SEASON	BASELINE	2050 @ RCP8.5	2090 @ RCP8.5
Summer	88.1 mm	89.8 mm (+2%)	97.8 mm (+11%)
Autumn	67.6 mm	65.5 mm (-3%)	66.2 mm (-2%)
Winter	52.7 mm	48.5 mm (-8%)	43.7 mm (-17%)
Spring	59.3 mm	57.5 mm (-3%)	54.6 mm (-8%)

#### 3.3 SEA LEVEL RISE AND FLOODING

Relative sea level has risen around Australia at an average rate of 1.4 mm per year between 1966 and 2009, and 1.6 mm per year after the influence of the El Niño Southern Oscillation (ENSO) on sea level is removed (CSIRO Climate Change Projections, East Coast Cluster Report 2015). Increasing global temperatures have a direct impact on sea level as the water expands with temperature and increases can also be expected from melting glaciers and ice caps. As temperatures are virtually certain to rise, sea levels are similarly virtually certain

to rise, in line with IPCC predictions **Invalid source specified.**. There is very high confidence that sea level will continue to rise during the 21st century. In the near future (2030), the projected range of sea-level rise for the cluster coastline is 0.07 to 0.18 m above the 1986–2005 level, with only minor differences between RCPs (CSIRO Climate Change Projections, East Coast Cluster Report 2015). As the century progresses, projections are sensitive to emissions pathways. By 2050, RCP8.5 gives a rise of 36cm, and by 2090, RCP8.5 gives a rise of 88cm (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

TABLE 9: EAST COAST SEA LEVEL PREDICTIONS FOR 2090

CLIMATE VARIABLE	2050 @ RCP8.5	2090 @ RCP8.5	
Sea Level Rise	24 cm above baseline	64 cm above baseline	

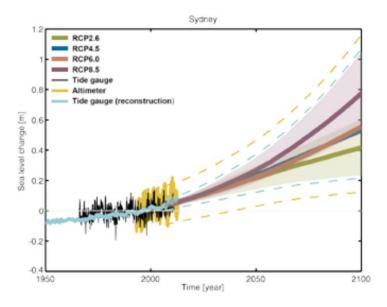

FIGURE 7: OBSERVED AND PROJECTED RELATIVE SEA LEVEL CHANGE (M) FOR SYDNEY HARBOUR (WHICH HAS CONTINUOUS RECORDS AVAILABLE (1966–2010) (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

The project is located inland away from the sea. The local topography means that school flooding due to sea level rise is not a risk.

#### 3.4 GUSTIER WIND CONDITIONS

There is high confidence in small changes to mean wind speed under RCP 8.5 scenarios by 2050. For 2090 changes are projected to remain small with winter wind speed projected to reduce with medium confidence under RCP8.5. These reduced winter wind speeds are assumed to be due to a projected southward movement of storm tracks and the subtropical ridge, thus weakening westerly winds (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

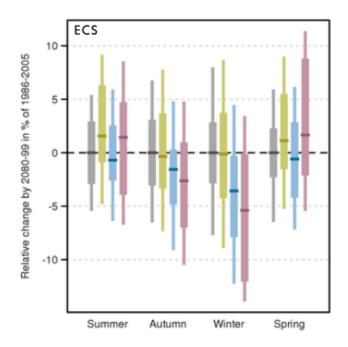

FIGURE 8: PROJECTED NEAR-SURFACE WIND SPEED CHANGES FOR 2090. ANOMALIES ARE GIVEN AS A PERCENTAGE WITH RESPECT TO THE 1986-2005 MEAN (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

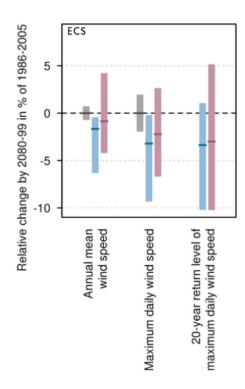

FIGURE 9: PROJECTED NEAR-SURFACE ANNUAL MEAN WIND SPEED, ANNUAL MAXIMUM DAILY WIND SPEED AND THE 20-YEAR RETURN VALUE FOR THE ANNUAL MAXIMUM DAILY WIND SPEED FOR 2090. ANOMALIES ARE GIVEN AS A PERCENTAGE WITH RESPECT TO THE 1986-2005 MEAN (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

#### 3.5 SOLAR RADIATION & RELATIVE HUMIDITY

Solar radiation and relative humidity are projected to have small changes for 2030 with high confidence. By 2090 there is low confidence in increased winter and spring radiation (related to decreases in cloudiness associated with reduced rainfall), medium confidence in decreases in relative humidity in summer and autumn, and high confidence in decreases in winter and spring (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

TABLE 10: SOLAR RADIATION AND HUMIDITY (BUREAU OF METEOROLOGY, HORSLEY PARK EQUESTRIAN CENTRE STATION NO. 067119) AND RELATIVE HUMIDITY (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

CLIMATE VARIABLE	BASELINE	2050 @ RCP8.5	2090 @ RCP8.5
Yearly Average Daily Solar Radiation	16.2 MJ/m2	16.6 MJ/m2 (+2.7%)	16.7 MJ/m2 (+3.4%)
Yearly Average 3 pm Humidity	49%	49.4 % (+0.9%)	49.6 % (+1.3%)

## 3.6 INCREASED EVAPORATION RATES, REDUCED SOIL MOISTURE, AND RUNOFF

There is high confidence that potential evapotranspiration will increase in the East Coast cluster in all seasons however, there is medium confidence about the magnitude of the increase. Changes to rainfall and evapotranspiration are projected to lead to a decrease in soil moisture, particularly in winter and spring, with medium confidence (CSIRO Climate Change Projections, East Coast Cluster Report 2015). There is medium confidence that runoff will decrease by 2050 and 2090 with RCP8.5 (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

#### 3.7 BUSH FIRE

Bushfire occurrence depends on four 'switches':

- 1) ignition, either human-caused or from natural sources such as lightning;
- 2) fuel abundance or load;
- 3) fuel dryness, where lower moisture contents are required for fire, and
- 4) suitable weather conditions for fire spread, generally hot, dry and windy Invalid source specified..

There is high confidence that climate change will result in a harsher fire-weather climate in the future. However, there is low confidence in the magnitude of the change, as this depends on the rainfall projection (CSIRO Climate Change Projections, East Coast Cluster Report 2015).

TABLE 11: MAXIMUM RECORDED TEMPERATURE, TIME IN DROUGHT AND FIRE WEATHER (BUREAU OF METEOROLOGY, HORSLEY PARK EQUESTRIAN CENTRE STATION NO. 067119) AND FUTURE PROJECTIONS (CSIRO CLIMATE CHANGE PROJECTIONS, EAST COAST CLUSTER REPORT 2015)

CLIMATE VARIABLE	BASELINE	2050 @ RCP8.5	2090 @ RCP8.5
Maximum Recorded Temperature (°C)	47° C	48.4° C (+1.4° C)	51.9° C (+4.9° C)
Time in Drought	38%	50%	60%
Fire Weather (Severe Fire Danger Days)	0.9 days	1.305 days (+45%)	2.07 days (+130%)

The site is situated in Georges River Council, the bushfire map is provided in Figure which shows the site is not identified as a bush fire prone area, however, could still be indirectly affected by a bush fire. So, risks associated with bushfires need to be considered in the design.

#### Your search result

You have conducted a search of the online bush fire prone land tool for the land in the map above. This search result is valid for the date the search was conducted. If you have any questions about the Bush Fire Prone Land Tool please contact bushfireprone.mapping@rfs.nsw.gov.au

The parcel of land selected is not identified as bush fire prone however you could still be affected by a bush fire.

FIGURE 10: NSW RURAL FIRE SERVICE BUSH FIRE PRONE LAND MAP

## 4 RISK ASSESSMENT & ADAPTATION PLAN

#### 4.1 RISK MANAGEMENT

Climate change adaptation is a risk management process just like any other risk considered by a successful modern business. The prioritisation of risk management actions comes from an informed understanding of the potential risks and the adaptation opportunities within the challenges ahead of us.

Modern business is ideally placed to tackle climate change, because businesses are inherently pragmatic and are used to change. However, the reason and time to act will be varied across the business community and must extend beyond legislated reporting of emissions and desire to curb energy use, to management of business risk for:

- Direct or physical risks
  - To physical assets, staff and visitors.
- Fiduciary liability
  - Fiduciary liability on Company Directors to consider and mitigate for climate change risk.
  - There is a real risk of 'litigation against a director who has failed to perceive, disclose or take steps in relation to a foreseeable climate-related risk that can be demonstrated to have caused harm to a company' (Hutley SC, 2016).
- Risk disclosure
  - Publicly listed companies are increasingly being pressured to normalise their climate risk disclosure practices. Particularly as the world moves towards a carbon-constrained future.
- Financial risk
  - Long term financial planning. 'Climate change is a financial risk if you've got a long-term asset portfolio'. Paul Fisher who retired as deputy head of the Bank of England's Prudential Regulation Authority (climatealliance.org.au, 2016).
- Social license
  - Social license to operate. Failure to maintain your business social license with customers and the broader community at large has often resulted in real consequences for business operations because the marketplace is savage to businesses that ignore reality.

#### 4.2 THE PROCESS

This Climate Adaptation Plan for Greenway Park Public School is the result of a collaborative and iterative risk management process engaging all relevant areas of the business as presented below:

- Step One: Climate projections with justification of modelling scenario.
- Step Two: Risk management workshop records potential climate change impact and risk level.
- Step Three: Risk management workshop records design and operational adaptation action and reassessed risk level.

#### 4.2.1 STEP ONE: BEFORE THE WORKSHOP – ESTABLISHING THE CONTEXT

Prior to the stakeholder workshop, NDY established the frameworks for identifying and analysing the risks identified for the project in relation to the climate projection data to ensure a common understanding amongst project stakeholders.

A Pre-Workshop Notice G-001[1.0] (dated 1st Nov 2024 and provided in Appendix B for context) was issued prior to the workshop with the intent of informing the stakeholders about the following:

- The site-specific climate change scenarios used to assume future changes.
- The scope of the assessment including the boundaries, timescales and emissions scenarios utilised.
- A 'Consequence Scale for Risk Assessment' and a 'Likelihood Scale for Risk Assessment' that would be used to define how the project risks would be classified and evaluated to measure the consequences, likelihoods and risk priorities for the project.

• Setting the priorities of the workshop to identify and describe the risks posed by climate change for the development, rating these using the above scales, as well as identifying and evaluating potential adaptation actions to mitigate any risks identified as unacceptable.

#### 4.2.2 STEP TWO: DURING THE WORKSHOP

The following stakeholders attended the workshop and/or included their views to contribute to the climate change assessment and analysis of risks for the project:

#### Attendees:

- Danielle Fogarty Sustainability Manager (SINSW)
- Frank Princi Project Manager (SINSW)
- Murgaja Karandikar Architect (Fulton Trotter)
- Syed Zaman Architect (Fulton Trotter)
- Jarrod Phillips Architect (Fulton Trotter)
- Nicholas Lau Project Manager (RPInfrastructure)
- Sarah Hamilton Project Manager (RPInfrastructure)
- Hock Ter Sustainability (NDY)
- Nicola Ring (NDY)
- Yolandi Cooper Civil (Meinhardt)

#### **Facilitators:**

- Richard Burton Sustainability (NDY)
- Sanjeev Ganda Sustainability (NDY)

All participants were provided with quantitative and descriptive information on the climate change scenarios and data produced by NDY's analysis (refer to Appendix C – Workshop Presentation).

The workshop generated a list of risks directly related to the site-specific data and project risks associated with climate change. These risks were then evaluated using knowledge of existing controls that are already designed to mitigate these risks, the consequences of the risks identified as well as the likelihood of their occurrence for this site. This, in turn, informed the priority rating for each risk identified in Appendix D – Risk Register.

The workshops included brainstorming exercises to identify additional risk controls or future measures to reduce the risk of hazards at the site.

#### 4.2.3 STEP THREE: AFTER THE WORKSHOP

The risk register established for the project was circulated to all attendees and project stakeholders for comment. All outstanding items have been collated by NDY in a project-specific Climate Change Risk Register, where 'High' or 'Extreme' risks were identified. All risk items identified will require the implementation of design elements and/or policies in place to be mitigated.

#### 4.3 IDENTIFYING ADAPTATION ACTIONS AND REASSESSING RISK

Once climate risk ratings have been applied to potential climate change risks, adaptation actions are identified to reduce the risk rating of extreme, high, medium, and low risk rated climate risks.

Generally, there are four possible approaches in responding to climate change:

- Avoid: Avoid locating assets in vulnerable areas or ignore and replace when required;
- Adapt: Design systems and adaption measures to operate in predicted future climate conditions. There
  are two approaches:
  - Respond Now (future proof through current measures), OR
  - Anticipate and Respond Later (enable future adaptive measures);
- Defend: Install defences at or around critical infrastructure:
- Retreat: Develop and implement plans to relocate from the vulnerable area.

The project looks to incorporate the above 'Adapt' measures where risks to the project have been identified. These can either be through design considerations or through future-proofing the asset to allow for flexible responses that will allow for adaptive measures to be implemented in the future. To address potential climate

change impacts and inform further design development and operational considerations, the mitigation measures are detailed in **Error! Reference source not found.**.

At a minimum, the Climate Adaptation Plan should be reviewed whenever the base information utilised to develop site-specific climate change scenarios has been updated or every five years, as good practice.

#### 4.4 IDENTIFIED RISKS

#### 4.4.1 TOP 2 RISKS

TABLE 12: TOP 2 IDENTIFIED RISKS

RISK#	HAZARD	DESCRIPTION OF IMPACT	CONTROLS IDENTIFIED IN WORKSHOP	CONSEQUENCE	BAU RISK	RESIDUAL RISK
01	Extreme Temperature	HVAC systems not maintaining internal conditions. Increase in electricity consumption due to higher temperatures combined with humidity. Mechanical equipment not performing.	The new learning block is to be served by an air cooled VRF air conditioning system. The system is designed for current climate conditions in Camel load calculation software, weather data obtained for closest weather station  Thus, the calculations for East Coast has already accounted above ASHRAE requirement by 1.8 °C DB in summer. Noting that the school has school holidays during peak summer and at other times finishes mid afternoon meaning the mechanical system wont be subjected to operating for the entire summer period and afternoon to evening.  The system is 100% electric, so it is unlikely to be replaced in the near future if the client aims to significantly reduce carbon emissions, compared to, say, a project going from a gas system to an electric one. Therefore, it is likely the replacement would only occur if the system does not meet performance requirements. Expected life span of the mechanical AC systems is approximately 15 years. Individual condensers may be isolated, decommissioned and replaced as required. We expect some technology advances to be made near the end of life cycles, which may allow higher capacity plant to be integrated into the same plant spaces. Condenser plant is situated on an open plant with louvre enclosure, adequate space has been provisioned to allow for individual plant replacement."	Moderate	High	Medium
02	Extreme Temperature	Uncomfortable internal conditions created during higher temperature weather events.	Building to NCC 2022 requirements only.	Moderate	High	Medium

For full details and risk and likelihood ratings at each timescale, refer to Appendix D Risk Register

#### 4.4.2 **FOLLOW-UP ACTIONS**

It is required that all 'High' and 'Extreme' risks be mitigated. Following the workshop no 'High' or 'Extreme' risks remain, however some items still require follow-up in future design phases.

TABLE 13: FOLLOW-UP ACTIONS

RISK NO	HAZARD	RISK	DESCRIPTION	FOLLOW-UP ACTION
		HVAC systems not maintaining internal conditions. Increase in electricity	A 5% safety factor to the sizing of the outdoor units is also applied to account for increase in temperature.  Outdoor condenser units are to be selected	Provide details of building fabric
01	Extreme Temperature	consumption due to higher temperatures combined with humidity. Mechanical	for a higher ambient temperature of 40 C°DB. There are manually operable louvres which will provide natural ventilation in classrooms. However the system is designed to cope mechanically.	performance. Provide datasheets of mechanical equipment selection.
		equipment not performing.	Thermal fabric performance exceeding NCC 2022 outlined in Risk 2.	
			- Building envelope consists thermally insulated walls with CFC, metal wall cladding or blockwork.	
		Uncomfortable internal conditions created during higher temperature weather events.	, ,	
02	Extreme Temperature		- Building is designed with passive design principles, and HVAC systems are further provided to meet thermal comfort requirements up to 40 C°DB. In the event of even higher temperatures HVAC systems will still operate, but won't hit the internal design temperatures.	Provide details of building fabric performance.
06	Heatwave Risk of Dehydration		Noted that multiple mitigations have been identified. It has been further noted that bubblers are intended to be provided as a further mitigation strategy. Must be detailed in future phases by the architect	Provide drawings detailing the location of bubblers and number of bubblers
18	Extreme Weather Events	Extreme winds could cause some trees to fall onto facility or people.	SI has a maintenance regime which involves an annual survey of all existing trees by a appropriately qualified arborist to assess any potential risks and mitigate them through appropriate maintenance measures e.g. pruning etc. These actions make damage to persons and property extremely unlikely.	Provide evidence from maintenance team that noted tree maintenance occurs as described (e.g. signed confirmation letter)

#### 4.4.3 **RISK REGISTER**

Refer to Appendix D. Risk Register

#### 5 GREEN STAR REQUIREMENTS

Within its Green Star Buildings v1.0 certification submission, the project is targeting 1 point for Credit 16 Climate Change Resilience (Credit Achievement).

The credit requirements are as follows:

- Completing the climate change pre-screening checklist and communicating risks to the applicant.
- Developing a project-specific climate change risk and adaptation assessment for the building.
  - o Using data for the representative concentration pathway RPC8.5.
  - Assess scenarios for one medium term timescale between 2040-2050 and one long term timescale between 2070-2090.
  - o Identify the primary and secondary climate change variables from Table 2 in AS5334:2013.
  - Define consequences and likelihoods for risks.
  - o Assess risks in consultation with the project team and relevant stakeholders.
  - o Develop a Risk Register and provide treatment options for 'high' and 'extreme' risks.
  - o Communicate the results of the assessment to all design discipline leads.
- Addressing extreme and high risks:
  - o All 'Extreme' risks must be addressed through specific design responses.
  - o All 'High' risks must be addressed through design or future operational responses.
  - Regardless of risk rating, at least two risks identified in the assessment must be addressed by specific design responses.
- Methodology must align with:
  - o AS 5334-2013, and
  - o AS/NZ ISO 31000:2009 Risk Management requirements.
- Suitably Qualified Professional: the consultant completing these works must hold a formal tertiary
  qualification in a relevant field with a minimum of five years' experience in climate risk and adaptation
  assessments.

This report has documented all of these requirements.

#### 5.1 DOCUMENTATION FOR GREEN STAR SUBMISSION

To meet Green Star methodology, a pre-screening checklist was completed early in the design process and a climate change risk assessment was undertaken.

A stakeholder workshop sought input from the design team to identify the likely risks associated with a changing climate and how these changes would impact on the project. Design and operational mitigation strategies were developed to reduce the risks highlighted as high and extreme risks, embedding resilience to future climate change into the design.

No 'High' or 'Extreme' risks due to climate change impacts remained following design elements and operational strategies (refer to Section 6.2).

NDY and the project team have addressed all requirements for *Credit 16. Climate Change Resilience* through this process, as described in the following table, and deem the project eligible for **Credit Achievement - 1 point**.

TABLE 14: ADRESSING GREEN STAR BUILDINGS V1.0 REQUIREMENTS

	CREDIT REQUIREMENTS						
Completing the applicant	Completing the climate change pre-screening checklist and communicating risks to the applicant						
Developing a	Using data for the representative concentration pathway RPC8.5	Section 2.5.2					
project- specific climate change risk	Assess scenarios for one medium term timescale between 2040-2050 and one long term timescale between 2070- 2090	Section 2.5.3					
and adaptation	Identify the primary and secondary climate change variables from Table 2 in AS5334:2013	Section 2.5.4					

	CREDIT REQUIREMENTS	ADDRESSED
assessment for the building	Define consequences and likelihoods for risks	Section 4.1 & Appendix D
	Assess risks in consultation with the project team and relevant stakeholders	Section 4.2
	Develop a Risk Register and provide treatment options for 'high' and 'extreme' risks	Section 2.5.2
	Communicate the results of the assessment to all design discipline leads	Section 4.3, 4.4 & Appendix B
Meet relevant Standards /	• AS 5334-2013	Section 2.6

	All risks rated as 'Extreme' must be addressed through specific design responses	Section 4.6, 5 & Appendix D
Addressing extreme and high risks	All risks rated as 'High' must be addressed through design or future operational responses	Section 4.6, 5 & Appendix D
	Regardless of risk rating, at least two risks identified in the assessment must be addressed by specific design responses	Section 4.6, 5 & Appendix D
	completing these works must hold a formal tertiary qualification in a with a minimum of five years' experience in climate risk and adaptation	Section 2.2 & Appendix A

#### 5.2 SUMMARY OF INITIAL AND REASSESSED RISKS

The initial climate change risk analysis pre-workshop identified twelve 'high' and two 'extreme' risks due to climate change impacts for 2090. With the introduction of adaptation measures, as part of the workshop these risks have been mostly reduced to 'medium' risk, with no remaining 'high' or 'extreme' risks for 2090.

TABLE 15: NUMBER OF RISKS IDENTIFIED

RISK RATING	YEAR	LOW	MEDIUM	HIGH	EXTREME	TOTAL
Business as Usual:	2040	5	9	3	0	17
Number of risks when considering business as usual design measures	2075	4	10	3	0	17
Residual Risks:	2040	7	10	0	0	17
Number of risks following adaptation measures	2075	7	10	0	0	17

#### 6 ASSUMPTIONS AND LIMITATIONS

The key assumptions underpinning this risk assessment are as follows:

- The purpose of the risk assessment is to highlight the potential for climate change induced risks and inform the decision-making process, which enables the design and operation of climate-resilient infrastructure.
- Risk assessment and mitigation is a dynamic and iterative process for the duration of the asset's life cycle. This report is the first step in the process.
- The assessment of risks and possible adaptation measures is qualitative and not quantitative.
- The climate change projections adopted are those that have been reasonably predicted for future climatic conditions. It should be noted that some projections currently involve a considerable degree of uncertainty.
- The climate projections are regional, not localised, so their accuracy is limited and subject to the uncertainties of scientific and technical research. They are however sufficient for the purposes of this assessment with recommendations representing professional judgement.
- Climate change projections are currently conservative given global data projections are still in the process of incorporating findings from the latest science published in the 6<sup>th</sup> IPCC Report (AR6).
- This plan does not ensure the implementation of any identified adaptation and resilience measures. It
  remains the responsibility of the project team and operational entities to incorporate the sustainability
  advise hereby provided.

#### **OFFICE LOCATION**

Perth, Western Australia, Australia

## DANA JUMP | SENIOR SUSTAINABILITY CONSULTANT

Dana is a sustainability management and advisory professional with expertise in infrastructure, built environment, and ESG clients. With 18 years of professional experience in the Australia & New Zealand Region, Dana has successfully developed and implemented sustainability strategies for ESG, Climate Change Resilience, Green Star, Infrastructure Sustainability and WELL Buildings accreditations.

Dana is passionate about challenging social norms and inspiring planners, designers, and constructors to create practical and meaningful sustainability outcomes. Currently, Dana holds an industry seat in the ISC Design and As Built Technical Working Group and Property Council of Australia Western Australian Planning and Infrastructure Committee.

#### RELEVANT PROJECT EXPERIENCE

#### **MIXED USE**

### Lots 1&2 The Oval, Subiaco East, Perth, Western Australia (2023 - Current | \$ Commercial in Confidence)

Lots 1 & 2 Subiaco Oval will deliver a market leading mixed-use development with Lot 1 incorporating a 30-storey residential tower and Lot 2 an 11-storey residential tower, including a shared underground carpark. NDY have been engaged for all core services including ICT / communications, vertical transportation and sustainability.

As a sustainability consultant, Dana provided timely and expert sustainability advice to integrate sustainable design principles and Green Star Buildings v1.0 requirements into project Lots 1&2 The Oval, ensuring high performance and sustainably responsible outcomes. Dana has conducted the climate change risk assessment for the project to include resilience adaptation options into the project design.

#### RAIL

### METRONET Byford Rail Extension Project, Perth, Western Australia, Australia (2022 | \$885 m)

The Armadale Line will be extended approximately 8km south to a new ground-level station in Byford, supporting one of the fastest growing areas in Australia. Armadale Station will be rebuilt as an elevated station with three nearby busy level crossings removed and replaced with elevated rail. The project will kick-start development opportunities in the Armadale and Byford town centres, providing new and safe connections around the stations.

In this position, Dana conducted climate change and resilience studies for IS and Green Star ratings, while also providing senior technical ISAP support for NDY and the broader alliance team as needed. This involved assisting with resource efficiency and life cycle assessment studies, as well as engaging with the design team to identify early sustainability rating alignment technical challenges and potential project opportunities.

### Papakura to Pukekohe Electrification Project, Auckland, New Zealand (2021 | NZ\$371 m)

The Papakura to Pukekohe rail electrification project will extend the electric train network approximately 20 kilometres south from Papakura to Pukekohe.

Auckland, New Zealand

## SANJEEV GANDA | SUSTAINABILITY CONSULTANT

Sanjeev joined NDY in 2019 after graduating from the University of Wellington with a Master of Building Science.

Sanjeev's technical sustainability experience includes climate change adaptation, daylight, thermal comfort, energy modelling, and structured sustainability frameworks such as Green Star.

Sanjeev has contributed to various projects with this diverse skill set, including offices, aged care, new builds, schools, and hotels in New Zealand and Australia.

Sanjeev's area of expertise is climate change adaptation and Life Cycle Assessment, where he strives to find solutions to adapt to and mitigate climate change impacts through an analytical approach.

#### RELEVANT PROJECT EXPERIENCE

#### **OFFICES NEW**

#### Sylvia Park 3 Te Kehu Way, Auckland, New Zealand (2021 - ongoing | NZ\$ 63M)

Construction of a second office building at Sylvia Park marking the next stage in the asset's continued mixed-use evolution. Located at 3 Te Kehu Way, the six-storey development will target a 6 Star Green Star rating and has been designed in response to tenant feedback.

Sanjeev worked in a technical advisory role, delivering the climate change adaptation workshop, risk assessment, climate adaptation plan and life cycle assessment for the project. Sanjeev also modelled the operational energy of the project and delivered the Green Star submission.

### Building 11 Central Park Greenlane, Auckland – Green Star & NABERSNZ (2022 - ongoing)

The KiwiRail Auckland Integrated Rail Management Centre, known as Building 11, is an integrated delivery between developers, Oyster Property, and KiwiRail to house the rail network teams in Auckland.

Sanjeev worked in a technical advisory role, delivering the climate change adaptation workshop, risk assessment, climate adaptation plan and life cycle assessment for the project.

#### **RESIDENTIAL**

#### Sylvia Park Build to Rent, Auckland, New Zealand (2021)

Sylvia Park Built to Rent development comprises 295 apartments across one 12storey and two 9-storey residential buildings.

Sanjeev worked in a technical advisory role, delivering the climate change adaptation workshop, risk assessment, climate adaptation plan and life cycle assessment for the project.

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

#### **RETAIL**

#### IKEA Sylvia Park, Auckland, New Zealand (2022)

The first New Zealand IKEA store has made a commitment to sustainability with targeting a 5-star Green Star Design and As Built v1.0 rating.

Sanjeev worked in a technical advisory role, delivering the climate change adaptation workshop, risk assessment, climate adaptation plan and life cycle assessment for the project.

#### Countdown Waimakariri, Kaiapoi, New Zealand (2022)

A new 3,600m² supermarket located in Kaiapoi, New Zealand targeting 5 Star Green Star Design & As Built NZ v1.0

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

#### **AGED CARE**

#### Fairway Gardens Care, Auckland New Zealand (2022)

A three-storey building situated within Fairway Gardens Village at the edge of Pakuranga golf course containing admin and back-of-house area, common areas, kitchen facilities, 62 care suites, and internal and external courtyards.

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

#### Pōhutakawa Landing, Auckland New Zealand (2022)

A two-storey building containing admin and back-of-house areas, 24 Care Suites, 17 Care Type A Suites, 8 Care Type B Suites, 15 Dementia Care Suites, common areas, kitchen facilities, internal and external courtyards, and a memory loop track.

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

#### Oakridge Villas, Kerikeri, New Zealand (2022)

A two-storey 65-bed residential care facility including 27 small care suites, 23 large care suites, a 15 memory care suite wing, common areas, and internal courtyards/memory gardens targeting 6 Star Green Star Design & As Built NZ v1.0

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

#### **INDUSTRIAL**

#### Fisher & Paykel Healthcare Building 5, Auckland, New Zealand (2022)

16,000m2 research and development facility located in Auckland, New Zealand targeting 5 Star Green Star Design & As Built NZ v1.0.

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

#### 30 Bowden Road, Auckland, New Zealand (2022)

Two 20,000m<sup>2</sup> two-storey warehouses located in Auckland targeting 5 Star Green Star Design & As Built NZ v1.0.

Working together with the design team, Sanjeev input into the design of the project, advising strategies to mitigate impacts resulting from climate change events like extreme rainfall and temperature.

PROJECT: SINSW - GREENWAY PARK PUBLIC SCHOOL (GPPS) CAN NO: G-001[1.0]

**UPGRADE** 

Date: 1 November 2024 Project No: 41153 - 001 Pages: 8

NAME	COMPANY	EMAIL
Via email		

#### SUSTAINABILITY - CLIMATE CHANGE ASSESSMENT: PRE-WORKSHOP NOTES

This consultant advice note aims to provide information to all stakeholders attending NDY's climate change adaptation workshop, where we will facilitate the consultation process to establish a Climate Adaptation Plan for the SINSW Greenway Park Public School Upgrade.

#### Workshop agenda

- Introduction
  - Climate change background
  - Purpose and process
  - Green Star Buildings methodology
- Climate Change Impacts on the SINSW Greenway Park Public School Upgrade
  - Assumptions and projections
  - Risk assessment
- Adaptation measures
  - Discussion
- Wrap-up/Next steps

#### The priorities for the workshop will be two-fold:

- 1. Identify and describe risks posed by climate change to the development and rate the consequence and likelihood of each,
- 2. Identify and evaluate potential adaptation actions and/or design strategies to mitigate unacceptable risks.

#### **Pre-reading**

#### Climate Adaptation Vs. Mitigation

Climate change adaptation is quite distinct from climate change mitigation:

- Mitigation is about making climate change less severe.
- Adaptation accepts that there will be some degree of climate change no matter how successful our combined mitigation efforts are - and looks to design communities and buildings that are resilient to it. This will be the focus of our workshop.

Please, familiarise yourself with the information listed below before the workshop scheduled for April 2024.

- Annex 1: Climate Projections
- Annex 2: Climate Hazard pre-screening checklist
- Annex 3: Climate Risk Assessment and Adaptation Register
- Annex 4: Consequence Scale for Risk Assessment
- Annex 5: Likelihood Scale for Risk Assessment

#### **Assumptions**

The climate assessment conducted for this project follows basic assumptions in line with Green Star Buildings v1.1 guidelines, as follows:

- 1. The two 'time scales' referenced throughout the risk assessment and adaptation planning process are 2050 (~25 years post-practical completion) and 2090 (65 years from occupation, noting the expected building life before major refurbishments is ~50-years).
- 2. The United Nations Intergovernmental Panel on Climate Change (IPCC) Representative Concentration Pathways (RCP) correspond to different greenhouse gas (GHG) concentration trajectories with each level based on different assumptions. The chosen pathway for this climate assessment is **RCP8.5**, which is representative of a high-emissions scenario if emissions continue to rise throughout the 21st century.

#### Data

Climate change projection and baseline data have been sourced from:

- Climate Change in Australia (CCIA) (a joint Bureau of Meteorology and CSIRO initiative)
- NSW / ACT Regional Climate Modelling (NARCliM) projections
- Intergovernmental Panel on Climate Change (IPCC) Sixth Assessment Report Chapter 11: Australasia
- Bureau of Meteorology Horsley Park weather station, which is closest to the site. Full references will be
  included in the final report.

We look forward to discussing this during the Climate Adaptation Workshop. If you have any questions or would like further information before the session, please do not hesitate to contact us.

NDY, A Tetra Tech Company

Time in Drought		38%	50%	60%	Time spent in drought is projected to increase (medium confidence) over the course of the century.
F' W II		0.0	1.305 days	2.07 days	There is high confidence that climate change will result in a <b>harsher fire-weather climate</b> in the future. However, there is low
tire Weather (Severe Fire Danger I	Days)	0.9 days	(+45%)	(+130%)	confidence in the magnitude of the change, as this is strongly dependent on rainfall projections and other fire 'switches.
 Sea Level Rise		_	13 cm above	64 cm above	Global mean sea level will continue to rise, and height of extreme sea-level events will also increase across Australia (very
			baseline		high confidence). However, it is not considered an issue in Canberra due to its proximity to the ocean.
Yearly Average Daily Solar Radiat	ion		16.6 MJ/m2	16.7 MJ/m2	Solar radiation is projected to increase (high confidence) over the course of the contunt
(MJ/m²)		16.2 MJ/m2	(+2.7%)	(+3.4%)	Solar radiation is projected to <b>increase</b> (high confidence) over the course of the century.
			49.4 % RH	49.6 % RH	
Yearly Average 3 pm Relative Humidity (%)		49.0 % RH			
			(+0.9%)	(+1.3%)	
Yearly Average 3 pm Wind Speed	(km/h)	16.6 km/h	17.0 km/h	17.3 km/h	There is medium confidence in <b>little change</b> to wind speeds.
Time in Drought  Fire Weather (Severe Fire Danger I  Sea Level Rise  Yearly Average Daily Solar Radiat (MJ/m²)	ion	175.0 mm 38% 0.9 days - 16.2 MJ/m2	48.5 mm (-8%) 57.5 mm (-3%) 189.0 mm (+8%) 50% 1.305 days (+45%) 13 cm above baseline 16.6 MJ/m2	43.7 mm (-17%) 54.6 mm (-8%) 218.8 mm (+25%) 60% 2.07 days (+130%) 64 cm above baseline 16.7 MJ/m2	spring rainfall is projected with high confidence. Summer and autumn rainfall is expected to increase to varying deprojected with less confidence due to natural climate variability, and this will remain the major driver of rainfall characteristic and the intensity of heavy rainfall events will increase over the course of the century, this because in a warming climate, rainfall extremes are expected to increase in magnitude mainly due to a warmer atmosphere being able to hold more moisture (Sherwood et al., 2010).  Time spent in drought is projected to increase (medium confidence) over the course of the century.  There is high confidence that climate change will result in a harsher fire-weather climate in the future. However, the confidence in the magnitude of the change, as this is strongly dependent on rainfall projections and other fire 'swite.

### ANNEX 2: CLIMATE HAZARD PRE-SCREENING CHECKLIST

CHECK LIST	CRITERIA RESPONSE [YES/NO]	HAS DATA REGARDING FUTURE CLIMATE Exposure been reviewed? [YES/NO]	HAS A RISK TO THE PROJECT BEEN IDENTIFIED? [YES/NO]	HAS A RISK TREATMENT BEEN IDENTIFIED? [YES/NO] IF YES, DESIGN OR OPERATIONAL MEASURE?
Has the project area been previously impacted by extreme climate events? (e.g., storms/tropical cyclones, extreme rainfall, and flooding, damaging winds, damaging hail, bushfires, heatwaves, drought, coastal inundation) Please indicate which events.	Yes The area has experienced extreme rainfall and flooding, heatwaves, and drought.	Yes	Yes Further risks will potentially be identified during consultation	
Is the project located in a cyclone zone?	No	Yes	No	
Is the project located in or adjacent to a bushfire-prone area?	No	Yes	No	This will be discussed in the Climate Adaptation Workshop.  A combination of design and operational design measures will likely
Is the project located in or adjacent to a flood- prone area?	Yes	Yes	No	be identified – refer to the climate risk and adaptation assessment for preliminary/suggested measures.
Is the project located at or adjacent to the coastline or tidally influenced waterway?	No	Yes	No	
Will the project accommodate occupants vulnerable to the impacts of climate extremes? (e.g., children, elderly, low mobility, seeking medical treatment) Please indicate potential groups of vulnerable occupants and which events they are likely to be exposed to.	Yes	Yes	No	

### ANNEX 3: CLIMATE RISK ASSESSMENT AND ADAPTATION REGISTER

ITEM	ASPECT	DESCRIPTION OF HAZARD		2050	2050	2090	2090
				LIKELIHOOD	RISK	LIKELIHOOD	RISK
01	Average Temperature	Accelerated material deterioration (colour fading or failure) due to higher temperatures.		Possible (Once in 25 years)	Low	Possible (Once in 25 years)	Low
02	Average Temperature	Cracking/failure of seals due to higher temperatures	Minor	Possible (Once in 25 years)	Medium	Likely (Once per year)	Medium
03	Average Temperature	Increase in electricity consumption due to higher temperatures	Minor	Likely (Once per year)	Medium	Likely (Once per year)	Medium
04	Extreme Temperature	HVAC not maintaining internal conditions during heat waves.	Moderate	Possible (Once in 25 years)	Medium	Likely (Once per year)	High
05	Extreme Temperature	Changes in occupant travel behaviour during heat waves (increased demand for carparking).	Insignificant	Unlikely (Once in 50 years)	Low	Unlikely (Once in 50 years)	Low
06	Droughts	Sediment/debris may build up in surrounding drainage infrastructure due to less frequent washout in drought. Build up of internal pressure.	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
07	Droughts	Structural cracking due to soil moisture changes	Major	Unlikely (Once in 50 years)	Medium	Unlikely (Once in 50 years)	Medium
08	Droughts	Risk of dehydration (and heat stroke in very extreme conditions) to occupants during increasingly hot days, particularly to vulnerable populations.	Major	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
09	Droughts	Soft landscape damage due to high temperatures or drought, planting dieback creating an unattractive external environment.	Minor	Possible (Once in 25 years)	Medium	Likely (Once per year)	Medium
10	Extreme Rainfall	Stormwater system blockages as a result of higher flows	Major	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
11	Extreme Rainfall	Water entering ground floor due to overland flow / localised flooding - may affect access to the building for occupants and emergency services.	Major	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
12	Extreme Rainfall	Prolonged periods of no rainfall	Insignificant	Possible (Once in 25 years)	Low	Possible (Once in 25 years)	Low
13	Sea Level Rise	Surrounding sewer / stormwater infrastructure impacted by storm surge.	Moderate	Rare (Once per lifetime)	Low	Rare (Once per lifetime)	Low
	Extreme Rainfall						
14	Extreme Wind	Extended blackouts due to transmission infrastructure failure or capacity being exceeded.		Possible (Once in 25	Medium	Possible (Once in 25	Medium
	Extreme Temperature		Major	years)		years)	
15	Hail / Snow / Lightning	Blocked downpipes/guttering as a result of hail	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
	Hail / Snow / Lightning		Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
16	Extreme Wind	Façade / solar PV / mechanical kit damage by hail / lightning / wind	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
	Extreme wind		Moderate	Unlikely (Once in 50 years)	Low	Unlikely (Once in 50 years)	Low
17	Hail / Snow / Lightning	Soft landscaping damage due to scouring or hail.	Insignificant	Possible (Once in 25 years)	Low	Possible (Once in 25 years)	Low

18	Bushfire	Increase in PM (particulate matter), CO2, bushfire smoke in the air and HVAC system.	Moderate	Unlikely (Once in 50 years)	Low	Unlikely (Once in 50 years)	Low
19	Dust Storms	Airborne dust soiling ventilation filters more quickly, dirtying solar panels more quickly, dirtying facade more quickly.	Minor	Rare (Once per lifetime)	Low	Rare (Once per lifetime)	Low
20	Extreme Wind	Extreme winds could cause some trees to fall onto the facility or people.	Major	Possible (Once in 25 years)	Medium	Likely (Once per year)	High

### **ANNEX 4: CONSEQUENCE SCALE FOR RISK ASSESSMENT**

SCALE OF RISK	SERVICE QUALITY	COMPLIANCE	INFRASTRUCTURE	FINANCIAL	SOCIAL
Insignificant	Minor deficiencies in principle that would pass without comment	Concerns about compliance would be resolved without special attention	No infrastructure damage, little change to infrastructure service	Little financial loss or increase in operating expenses	No adverse human health effects.
Minor	Services would be regarded as satisfactory, but personnel would be aware of deficiencies	Minor perceived or actual breaches of compliance would be resolved	Localised infrastructure service disruption, no permanent damage. Some minor restoration work required. Early renewal of infrastructure by 10- 20%. Need for new/modified equipment	Additional operational costs. Financial loss is small <10%.	Short-term disruption to employees, customers or neighbours.
Moderate	Services would be regarded as barely satisfactory by the general public and the organisation's personnel	Formal action would be required to answer perceived breaches or charges of compliance failure	Limited infrastructure damage and loss of service. Damage recoverable by maintenance and minor repair. Early renewal of infrastructure by 20- 50%	Moderate financial loss 10-50%	Frequent disruptions to employees, customers or neighbours.
Major	The general public would regard the organisation's services as unsatisfactory	Significant amounts of management and advisers' effort would be required to answer charges of compliance failures	Extensive infrastructure damage requiring major repair. Major loss of infrastructure service. Early renewal of infrastructure by 50- 90%	Major financial loss 50-90%	Severe disruptions to employees, customers or neighbours.
Catastrophic	Services would fall well below acceptable standards and this would be clear to all	Obvious and proven breaches of legal and regulatory requirements with the prospect of corporate or individual penalties	Significant permanent damage and/or complete loss of the infrastructure and infrastructure service. Loss of infrastructure support and translocation of service to other sites. Early renewal of infrastructure by >90%	Extreme financial loss >90%	Total disruption to employees, customers, or neighbours.

### **ANNEX 5: LIKELIHOOD SCALE FOR RISK ASSESSMENT**

RATING	DESCRIPTOR	RECURRENT OR EVENT RISKS	LONG TERM RISKS
Almost Certain	Could occur several times per year	Has happened several times in the past year and in each of the previous 5 years  or  Could occur several times per year	Has a greater than 90% chance of occurring in the identified time period if the risk is not mitigated
Likely	May arise about once per year	Has happened at least once in the past year and in each of the previous 5 years or May arise about once per year	Has a 60-90% chance of occurring in the identified time period if the risk is not mitigated
Possible	Maybe a couple of times in a generation	Has happened during the past 5 years but not in every year or  May arise once in 25 years	Has a 40-60% chance of occurring in the identified time period if the risk is not mitigated
Unlikely	Maybe once in a generation	May have occurred once in the last 5 years or May arise once in 25 to 50 years	Has a 10-30% chance of occurring in the future if the risk is not mitigated
Rare	Maybe once in a lifetime	Has not occurred in the past 5 years or Unlikely during the next 50 years	May occur in exceptional circumstances, i.e. less than 10% chance of occurring in the identified time period if the risk is not mitigated

### **APPENDIX C. WORKSHOP PRESENTATION SLIDES**

Refer over.

08 November 2024

## SYDNEY METRO SOUTH CLUSTER (KOGARAH, DALMENY, GREENWAY PARK AND KINGSWOOD)

## **AGENDA**

Introduction (5-10 min)

- o Purpose and Importance
- o Climate change projections

Climate Change Impacts on the project (10-15 min)

- o Assumptions and projections
- o Green Star methodology

Adaptation measures (30-40 min)

o Discussion

Wrap-up/Next steps (5 min)

## **DEFINITIONS**

**Weather** - Atmospheric conditions at a specific place and time.

Climate - Weather conditions at a specific place over a long period.

Mitigation - Reducing our contribution towards climate change.

**Adaptation -** Accepts that there will be some degree of climate change no matter how successful our combined mitigation efforts are - and looks to design buildings that are resilient to it. **This will be the focus of our workshop.** 

# **PURPOSE**

## **PURPOSE**

Understand the future impacts on the project.

Identify solutions to mitigate these impacts for a more resilient project.

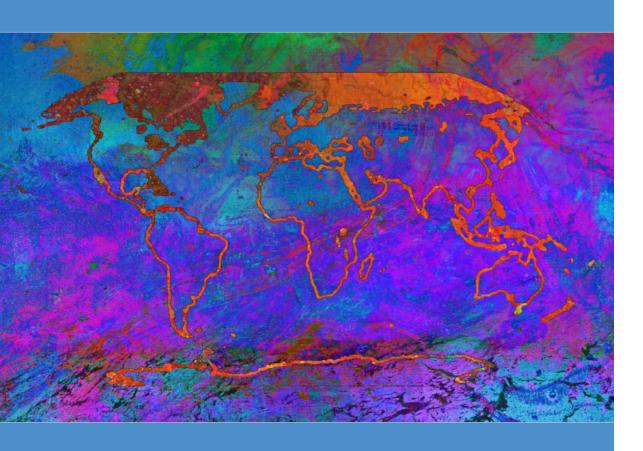

# **IMPORTANCE**

## Climate Change 2021

The Physical Science Basis

## CLIMATE CHANGE WIDESPREAD, RAPID AND INTENSIFYING

- IPCC

### REPORT FINDINGS

Target is to limit change in global temperature to 1.5 °C above preindustrial levels.

Beyond this and there will be irreversible damage.

Global temperature **already risen by 1.1 °C** with only 0.1 °C caused by natural forces.

1.5 °C will probably be reached and exceeded within the next two decades.

Immediate, rapid and large-scale action required to reduce greenhouse gas emissions to limit rise to 1.5 °C

### **ASSUMPTIONS**

Time scales:

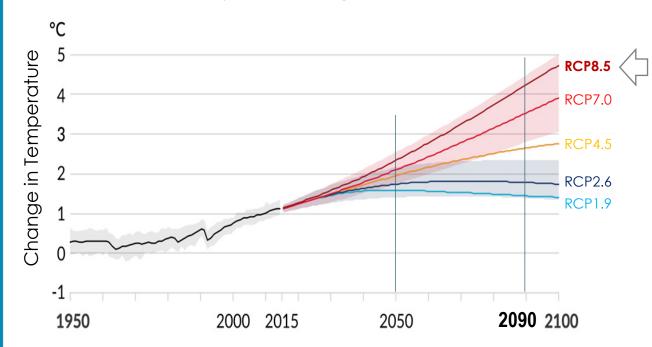

**2050** +25 years from Practical Completion

**2090** +65 years

#### **RCP8.5**

High-emissions scenario, and the most likely scenario as agreed throughout the industry.

Global surface temperature changes relative to 1850-1900

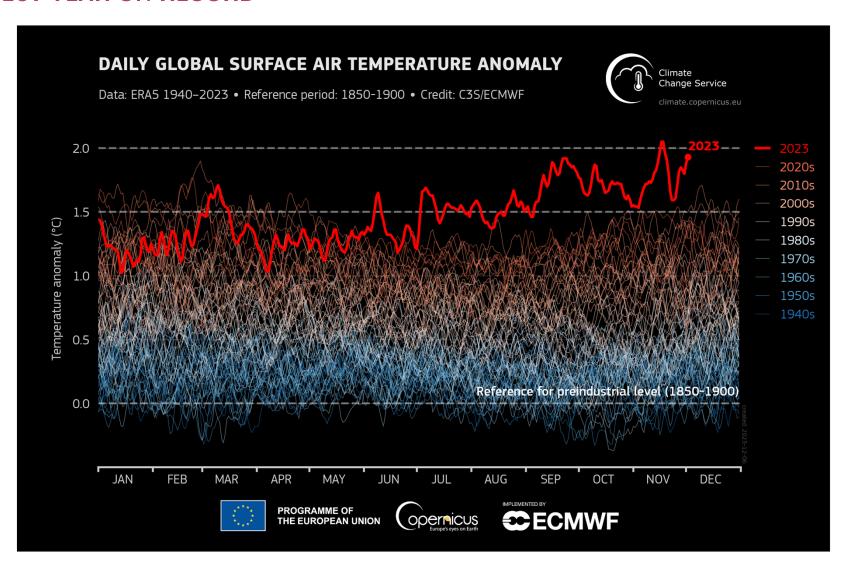

### Representative Concentration Pathways (RCP)

by the United Nations Intergovernmental Panel on Climate Change (IPCC) are scenarios for different greenhouse gas (GHG) concentration.

### **GLOBAL - 2023 IN REVIEW**

### HOTTEST YEAR ON RECORD

### **AUSTRALIA- 2023 IN REVIEW**

# 2023 WAS AUSTRALIA'S EIGHTH-HOTTEST YEAR ON RECORD (BOM, 2024)

Western Australia hitting highs of 49.5°

Central WA, southern QLD and northern NSW temperatures on average between +1.5°C to +2.5°C warmer than normal

Rainfall was slightly above average

2011 – 2020 Warmest decade on record

### **DUST STORM**

September 2009 Eastern Australia

### **HEATWAVE**

2012-2013 Australia

### **BUSHFIRE**

2019-2020 Australia

### **BUSH FIRE PRONE AREA**

Bushfire in Northmead Reported in November 2020, (Nine News, 2020)

# BUSH FIRE January 2020 South Coast

(Georges River Council, 2024)

**Rainfall** 110 mm (20/03/2021)

Damage Claims 11,000

Damage Estimated at \$1 billion

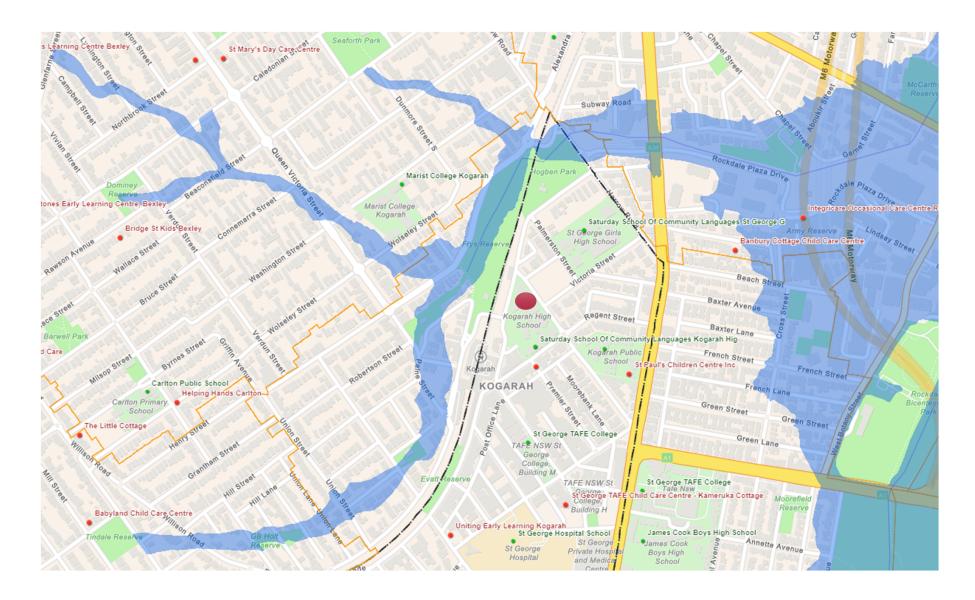

Multiple Recent Flood Events (2020 & 2021)

# SEVERE WEATHER AND FLOODING

February 2020 Sydney

# CLIMATE PROJECTIONS — SYDNEY METRO SOUTH (2050 AND 2090)

Temperature - A continued increase in seasonal mean temperature +2.5 °C by 2050 and +5.0 °C by 2090

Temperature - Increase in hot days >40 °C

	Today	2050	2090
Over 35 °C	5.5	5	15
Over 40 °C	0.9	0.8	3.3
Time in Drought	38%	50%	60%

Solar Radiation, Wind, humidity – Similar to today

# CLIMATE PROJECTIONS — SYDNEY METRO SOUTH (2050 AND 2090)

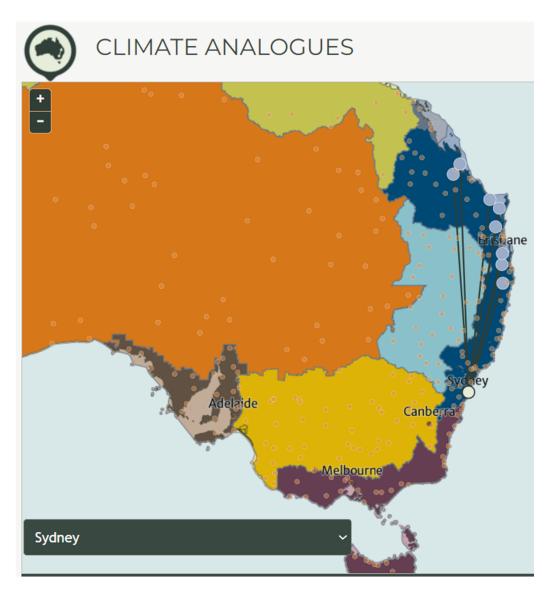

Rain – Wetter summers and drier winters expected

Extreme Rainfall - Increase in intensity of extreme rainfall events

Severe Fire Days – Increase from 1.1 to 2.31 by 2090

# WHAT DOES THIS ALL MEAN?

The climate in Sydney 2090 will resemble the current day climate in:

Bundaberg

Beaudesert

Brisbane

Yeppoon

Mount Morgan

Casino

Hervey Bay

Gympie

# WHAT DOES THIS ALL MEAN?

Heavy rain - Capacity of stormwater systems may be exceeded, causing flooding

Coastal - Coastal erosion and inundation

**Drought** - More frequent droughts are likely to lead to water shortages, increased demand for irrigation and increased risk of wild fires.

**Agriculture** - Warmer temperatures and a longer growing season could provide opportunities to grow new crops. Prolonged drought and greater frequency and intensity of storms may counteract these benefits.

**Biosecurity** - Warmer, wetter conditions could increase the risk of invasive pests and weeds.

**Disease** - There may be an increase in the occurrence of summer water-borne and food-borne diseases, such as Salmonella.

# GREEN STAR AND EFSG

# **GREEN STAR BUILDINGS CREDIT 16**

## Climate Change Resilience

#### Resilient

Credit: 16

Points: 1

#### Outcome

The building has been built to respond to the direct and indirect impacts of climate change.

### Criteria

Minimum Expectation	Nil	<ul> <li>The project team completes the climate change pre-screening checklist. The project team communicates the building's exposure to climate change risks to the applicant.</li> </ul>
Credit Achievement	1 Point	In addition to the Minimum Expectation:  The project team develops a project-specific climate change risk and adaptation assessment for the building.  Extreme and high risks are addressed.

## **EFSG CLIMATE CHANGE ADAPTATION**

Sites and school communities must be able to withstand natural and urban hazards and adaptively respond to climate change over time, especially for projects involving vulnerable communities.

Climate events for consideration include: exacerbated flood, storm surge, inundation, heatwaves, bushfires, extreme storms and other weather events.

Where significant risks are identified in the initial assessment, a comprehensive climate change risk assessment must be undertaken. Any high or extreme risks must be addressed through design measures.

# **IMPACTS**

- HVAC systems not maintaining internal conditions. Increase in electricity consumption due to higher temperatures.
- Heat island effect affecting mech equipment
- Mechanical equipment not performing.
- Uncomfortable internal conditions are created during higher-temperature weather events.

2040	2075
RISK	RISK
Medium	Medium

## **EXTREME TEMPERATURE**

- Accelerated material deterioration (colour fading or failure) due to greater solar radiation and higher temperatures.
- Cracking or failure of seals due to greater solar radiation and higher temperatures.
- High touch point materials subject to high temperatures.
- Less occupant movement outside due to more extreme temperature and humidity, and associated reduction of occupant health and wellbeing.

2040	2075
RISK	RISK
Medium	Medium

2040	2075
RISK	RISK
Low	Low

2040	2075
RISK	RISK
Medium	Medium

 Soft landscape damage due to high temperatures or drought, planting dieback creating an unattractive external environment.

2040	2075
RISK	RISK
Medium	Medium

- Sediment / debris may build up in surrounding drainage infrastructure due to less frequent washouts in drought.
- Water needs of the site (both quantity and quality) not met due to reduced rainfall and prolonged periods of drought.

2040	2075
RISK	RISK
Medium	Medium

## **EXTREME TEMPERATURE/RAIN**

- Risk of structural stability of building and foundation systems affected by water table height increases, causing changes to ground structure.
- Changes to soil conditions: Softening soils, shrinking, swelling of soils from changes in moisture condition.

2040	2075
RISK	RISK
Medium	Medium

- Water entering the building due to overland flow/localised flooding.
   Stormwater system sizing.
- Water entering ground floor critical infrastructure rooms (e.g. transformer room, comms, pump room etc.).

2040	2075
RISK	RISK
Medium	Medium

 Extended blackouts due to transmission infrastructure failure or capacity being exceeded. Resulting in impacts to students and visitors, such as disruption of regular operations and services.

2040	2075
RISK	RISK
Medium	Medium

## **EXTREME RAIN**

## Impact Item

 Roofing/roof-mounted equipment damaged by lightning. 2040 2075

RISK RISK

Low Low

• Facade damage by lightning.

 Risk of injury to occupants during extreme rainfall events, cyclones and atmospheric river events particularly to vulnerable populations.

2040	2075
RISK	RISK
Medium	Medium

• Roofing/roof-mounted equipment damaged by hail.

2040	2075
RISK	RISK
Low	Low

- Wind driven rain on wall claddings
   particularly at junctions. Consideration
   to different types of cladding profiles,
   orientation of laps away from the
   prevailing wind direction, taping of joints
   etc
- Damage to the facade and roofing materials during storm weather events and the potential for materials to become detached due to strong winds.
   Pressure impacts on the building.

2040	2075
RISK	RISK
Low	Low

• Extreme winds could cause some trees to fall onto facility or people.

2040	2075
RISK	RISK
High	High

- Increase in PM (particulate matter), CO2, bushfire smoke in the air entering the building.
- Smoke / dust impacting air quality indoors.
- Disruptions to services (e.g. power and transport) due to nearby fires.

2040	2075
RISK	RISK
Medium	Medium

- Gutters and downpipes are unable to handle rainfall during extreme rainfall events, cyclones and atmospheric river events
- Debris blocking gutters and downpipes.

Concoguence	2040 @ R	CP8.5	2075 @ RCP8.5			
Consequence	Likelihood	Risk	Likelihood	Risk		
Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		

Descriptor
Insignificant

Moderate
Major
Catastrophic

# WRAP UP / NEXT STEPS

NDY will circulate the Risk/Response matrix by early Tuesday

- Incorporating today's feedback
- o For stakeholders to populate with any further input/comments
- Return to NDY within 1 week

NDY will turn this into the SINSW Climate Adaptation and Resilience Plan

 We will circulate the full report for review and comments prior to end-ofyear

The project must implement key responses

 Track the incorporation of design and operational responses agreed within the plan, to ensure they are delivered

## **APPENDIX D. RISK REGISTER**

Refer over.

## Climate Change Adaptation Risk Register

Greenway Park Public School Upgrade 0120.0041153.0001 Project: Project No:

Item	Hazard	Description of Impact	Environment	Social/Cultural	Financial	Discipline	Existing Controls Identified During Workshop		BAU 2040 @		BAU 2075 @	
							The new learning block is to be served by an air cooled VRF air conditioning system. The system is designed for current climate	Consequence	Likelihood	Risk	Likelihood	Risk
01	Extreme Temperature	HVAC systems not maintaining internal conditions. Increase in electricity consumption due to higher temperatures combined with humidity. Mechanical equipment not	More electricity use resulting in increased greenhouse gas emissions. Moderate	Uncomfortable occupants. Moderate	Increase cost to the school (more electricity purchased). Moderate	Mechanical	conditions in Camel load calculation software, weather data obtained for Sydney Airport, NSW (closest weather station).  Thus, the calculations for East Coast has already accounted above ASHRAE requirement by 1.8 °C DB in summer. Noting that the school has school holidays during peak summer and at other times finishes mid afternoon meaning the mechanical system wont be subjected to operating for the entire summer period and afternoon to evening.  The system is 100% electric, so it is unlikely to be replaced in the near future if the client aims to significantly reduce carbon emissions, compared to, say, a project going from a gas system to an electric one. Therefore, it is likely the replacement would only occur if the system does not meet performance requirements. Expected life span of the mechanical AC systems is approximately 15 years. Individual	Moderate	Likely (Once per year)	High	Likely (Once per year)	High
		performing.					condensers may be isolated, decommissioned and replaced as required. We expect some technology advances to be made near the end of life cycles, which may allow higher capacity plant to be integrated into the same plant spaces. Condenser plant is situated on an open roof plant with louvre enclosure, adequate space has been provisioned to allow for individual plant replacement.					
02	Extreme Temperature	Uncomfortable internal conditions created during higher temperature weather events.	More electricity use resulting in increased greenhouse gas emissions. Moderate	Uncomfortable occupants. Moderate	Increase cost to the school (more electricity purchased). Moderate	Architecture, Mechanical	Building to NCC 2022 requirements only.	Moderate	Likely (Once per year)	High	Likely (Once per year)	High
05	Extreme Temperature	High touch point materials subject to high temperatures.	N/A	Occupants may experience discomfort when touching materials	N/A	Landscape, Architectural, Operations	Minor impact - No further action required.	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
06	Heatwave	Risk of dehydration (and heat stroke in very extreme conditions) to occupants during increasingly hot days, particularly to vulnerable populations.	N/A	Occupants health affected.  Risk of dehydration to occupants  Moderate	N/A	Operations	All external walkways are covered, extensive shading provided to facades and trafficable areas. HVAC systems will cool interior spaces.  Noted that bubblers are intended to be provided. Details to be provided during future design phases.  School operational response during heatwaves involves keeping children indoors, and during extreme heatwaves shutting the school School holiday period runs from December/Jan, limiting the exposure risk	Moderate	Likely (Once per year)	High	Likely (Once per year)	High
07	Heatwave	Less occupant movement outside due to more extreme temperature and humidity, and associated reduction of occupant health and wellbeing. Students likely to stay inside during lunch breaks.	N/A	Occupants are forced to use alternate entrances.  Occupants attracted to site for longer periods as a refuge from the heat. Minor	N/A	Architecture	Shade structure connects existing building M and existing covered walkway network to the proposed building.  Roof overhang to verandah of proposed building.  School holiday period runs from December/Jan, limiting the exposure risk  School operational response during heatwaves involves keeping children indoors, and during extreme heatwaves shutting the school Proposed trees will provide some shading to northern facade when mature.	Minor	Likely (Once per year)	Medium	Likely (Once per year)	Medium
08	Droughts	Soft landscape damage due to high temperatures or drought, planting dieback creating an unattractive external environment.	Wastage of planting. Minor	Negatively aesthetically pleasing landscaping. Drop in occupant satisfaction. Minor		Landscape, Hydraulics	Predominantly native and drought tolerant species have been selected, appropriate for the local climatic conditions. Planting plans avoid extensive planting of single species in a contained area, to avoid failure of a particular plant resulting in areas of sparse planting.  Operationally SINSW expects that grassed areas will brown during drought periods and accepts this is standard.	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
09	Droughts	Sediment / debris may build up in surrounding drainage infrastructure due to less frequent washouts in drought.	Overflow of water onto site. Minor	Occupants forced to use alternate entrances. Occupants unable to occupy the building. Minor		Civil, operations	Meinhardt (civil) noted that this is not expected to be an issue at school site. No further actions required.	Minor	Unlikely (Once in 25-50 years)	Low	Unlikely (Once in 25-50 years)	Low
10	Droughts	Water needs of the site (both quantity and quality) not met due to reduced rainfall and prolonged periods of drought.	Water consumption during times of limited water availability. Minor	Restrictions in water use causing compromised operations.	N/A	Hydraulics	No new rainwater storage proposed. All planter box landscape species are ultra-low water use species. Grassed areas are expected to brown during extended drought periods. SINSW notes that this is an acceptable outcome, and is standard practice across all schools.  Scope of water end uses for school is minor; Bubblers, Toilets, Cleaners cupboard and refill tap. In the event of drought Shoalhaven Water does not restrict any of the water uses in this project. (restrictions apply to car washing, swimming pools and lawn/garden watering)  High efficiency fittings and fixtures are selected as per the patternbook.	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
11	Bushfire	Increase in PM (particulate matter), CO2, bushfire smoke in the air entering the building.	N/A	Damage to property and systems due to smoke ingress. Results may included downtime of systems. Moderate	Servicing of damaged equipment related ingress of bushfire smoke. Minor	Mechanical	NDY Mech, 27.11.24 Outside air intakes are to be fitted with bushfire rated ember mesh in order to comply with the bushfire report. Units are expected to turn off during fire mode (smoke is detected by the smoke sensor) and thus bushfire smoke in the air entering the building is unlikely. Note that NCC 2022 SPEC 43 compliance (i.e., units to remain operational up to 4 hrs during bushfire) is not pursued for East Coast.  Schools will not be open during bushfire and extreme smoke events.  AC units are to be fitted with high efficiency F5 filters to reduce particulate matter and dust circulation.	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
13	Extreme Rainfall	Risk of injury to occupants during extreme rainfall events particularly to vulnerable populations.	N/A	Occupants injure themselves.  Occupants are forced to use alternate entrances.  Minor.	N/A	Architectural	Fulton Trotter Architect - All floor surfaces to be slip resistant, compliant with AS1428.1 with minimum slip ratings to BCA Table D3D15, AS4586 and Australian Standards Handbooks HB 197 & HB 198 (wet pendulum method) to suit context/location.	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
14	Extreme Rainfall	Gutters and downpipes are unable to handle rainfall during extreme rainfall events Debris blocking gutters and downpipes.	Overflow of water onto the site. Moderate	Occupants are forced to use alternate entrances.  Moderate.	Cost to fix any damages. Moderate	Hydraulic, Architecture, Civil, Operations	Gutters are designed to relevant Australian Standards i.e. 1 in 20 year 5 minute event. with some inherent safety buffer as part of the standard. The gutter and downpipe sizing does not account for future climate. However impacts are mitigated through the following:  - All gutters as per patternbook designed to be eaves gutter which allow water to simply overtop and spill. (as opposed to box gutters where water may enter the structure).  - Significant eaves on all sides of the building ensure that significant clearance is provided away from the facade for any spilling water.  - SINSW standard maintenance involves clearing gutters and downpipes of debris.	Moderate	Unlikely (Once in 25-50 years)	Low	Possible (Once in 25 years)	Medium
15	Extreme Rainfall	Water entering the building due to overland flow/localised flooding. Stormwater system sizing.  Water entering ground floor critical infrastructure rooms (e.g. lift pits).	Refurbishment works to fix systems would result in demolition materials sent to landfill. Increase in greenhouse gas emissions due to construction work. Minor	Occupant access to spaces may be restricted during event and during replacement of building elements. Major	Cost to fix any damages. Moderate	Civil, Electrical, Mechanical	- All gutters as per patternbook designed to be eaves gutter - Risk of egress expected to be minimised due to overhang of gutters – collected by civil - Eaves allow for 1 in 20 yr. storm event, in line with current Australian standards and drain away from trafficable areas / critical infrastructure nominal floor level to ensure overland flood is are not an issue.	Major	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium
18	Extreme Weather Events	Extreme winds could cause some trees to fall onto facility or people.	Wastage of planting. Minor	Major	Cost to replace landscaping planting more frequently. Moderate	Landscape, Operations	School has a limited number of trees only, inherently lowering the risk of tree damage.	Major	Unlikely (Once in 25-50 years)	Medium	Unlikely (Once in 25-50 years)	Medium
19	Extreme Weather Events	Extended blackouts due to transmission infrastructure failure or capacity being exceeded. Resulting in impacts to students and teachers, such as disruption of regular operations and services.	N/A	Uncomfortable Occupant. Occupant will feel dissatisfied in the space. Minor	N/A	Electrical, Comms, Operations	Addressed primarily in operational response. If blackouts occur there are no immediate risks to occupants. All regularly occupied spaces have good access to daylight (and are only occupied during daylight hours), spaces are also able to be naturally ventilated as per the mixed mode requirements of the mechanical system. During extended blackouts the schools would send students home / not-open.  Generators not intended to power the school during blackout school will close during extended blackout events.	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium

Potential New Controls (Adaptation Measures)	Consequence	Residual 2040		Residual 2075			
		Likelihood	Risk	Likelihood	Risk		
A 5% safety factor to the sizing of the outdoor units is also applied to account for increase in temperature.  Outdoor condenser units are to be selected for a higher ambient temperature of 40 C°DB. There are manually operable louvres which will provide natural ventilation in classrooms. However the system is designed to cope mechanically.  Thermal fabric performance exceeding NCC 2022 outlined in Risk 2.	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		
Fulton Trotter Architects  - Building envelope consists thermally insulated walls with CFC, metal wall cladding or blockwork.  - Building insulation is specified above NCC Section J Minimium requirements  - External window sizes are minimised to meet natural lighting requirements. The large roof overhangs, verandah and sun hoods to the windows will provide significant shading to windows.  - Building is designed with passive design principles, and HVAC systems are further provided to meet thermal comfort requirements up to 40 C°DB. In the event of even higher temperatures HVAC systems will still operate, but won't hit the internal design temperatures.	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		
	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		
Bubblers to be provided.  Numbers to be confirmed.  Bubblers location to be confirmed.	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		
	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium

	Moderate	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		
	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		
The roof design ensures that roof slopes away from the trafficable side of the building, so any overflowing water falls toward non-trafficed side of the building, and onto permeable ground.	Moderate	Unlikely (Once in 25-50 years)	Low	Unlikely (Once in 25-50 years)	Low		
	Major	Rare (Once in 50 years)	Low	Rare (Once in 50 years)	Low		
Locations of new trees have been carefully considered to reduce future risks associated with adverse weather events. It is expected that the proposed trees receive a reasonable amount of water to ensure they successfully establish.  SI has a maintenance regime which involves an annual survey of all existing trees by a appropriately qualified arborist to assess any potential risks and mitigate them through appropriate maintenance measures e.g. pruning etc. These actions make damage to persons and property extremely unlikely.	Major	Rare (Once in 50 years)	Low	Rare (Once in 50 years)	Low		
	Minor	Possible (Once in 25 years)	Medium	Possible (Once in 25 years)	Medium		

### Climate Change Adaptation Risk Register

Extreme Saltwater spray due to the site's proximity to the ocean and corrosion on services systems and materials.

Sea Level Rise Sea level rise flowing onto the site.

Premature damage t building façade elements. Insignificant

N/A

Services, Architecture, Operations

Greenway Park Public School Upgrade 0120.0041153.0001

"	Пагаги	Description of impact	Environment	Social/Cultural	Fillalicial	Discipline	Existing Controls Identified During Workshop	Consequence	Likelihood	Risk	Likelihood	Risk
3	i ianthina	Lightning strike to building during storm events.	Increase in greenhouse gas emissions due to construction work. Minor	Building services may not run as designed without replacement. Occupant access to spaces may be restricted during the replacement of building elements. Moderate	Cost to fix any damages such as façade discolouration. Moderate	Electrical	NDY Elec, 25.11.24: Surge protections devices are proposed at the Main switchboard and all new distribution boards to protect against lightning strikes. Based on lightning risk assessment as per AS1768 Lightning Protection, no further lightning protections are required. This will prevent permanent damage to building services in the event of lightningt strike.	Moderate	Rare (Once in 50 years)	Low	Unlikely (Once in 25-50 years)	Low
1	Hail		to fix systems would result in demolition	Building services may not run as designed without replacement.  Occupant access to spaces may be restricted during the replacement of building elements.  Temporary teaching spaces required during refurbishment. Moderate	Cost to fix any damages. Moderate	Architecture, Services	NDY Mech, 27.11.24 Hail damage is unlikely as hail occurrence in East Coast climate is minimal however hail guard will be specified for condensers.	Moderate	Unlikely (Once in 25-50 years)	Low	Unlikely (Once in 25-50 years)	Low

Sites are located close to the coast, though not immediately adjacent to them (400m from sea). As such limited amounts of sea spray may hit the site during extreme winds. This amount is not enough to constitute a signficant risk

Civil GIS data from Climate Change In Australia has been reviewed to determine that even in the most extreme climate change scenario, sea level rise will not directly impact the site. As such this risk is Not Applicable.

Possible (Once in 25 years)
