## INTRODUCTION

## Scope

This report provides site and soil assessment for on-site effluent disposal at the applicant's proposed seven-bedroom dwelling. The report considers the earlier *Land Capability Assessment* prepared for the subdivision by Franklin Consulting. Based on mapping around buffer distances to bores and watercourses in this earlier subdivision report, the area proposed as suitable for effluent application on the subject lot is not considered a special effluent management area which would otherwise require subsurface irrigation only.

An AWTS coupled with surface or subsurface irrigation is proposed, which provides a suitable form of effluent treatment for the site and soil characteristics of the land in question.

The management recommendations include the size and location of the proposed irrigation area.

Franklin Consulting Australia (11 December 2020)

## SITE CHARACTERISTICS

The terrain of the site comprises a gently inclined mid-slope of 3-4 degrees overlying Ordovician metasediments of the Pittman Formation. The slope across the proposed irrigation area has a linear planar configuration ensuring effluent does not concentrate within the site. The soil at the site is an imperfectly drained Chromosol within the Bywong soil landscape. It comprises a clay loam topsoil horizon to 20cm, overlying clay loam then light clay subsoil horizons to 52cm and 100cm+ respectively.

## SITE EVALUATOR

Company Land Capability Services

Name Richard Miller ph: 0417 694 638

email: December 16, 2024

## SITE INFORMATION

Address Lot 20 DP271494, 52 Woodbury Drive,

Sutton, NSW 2620

dille

Council area Yass Valley

Owner/developer Urbanology/Campbell

Area: 5005m<sup>2</sup>
Site plan attached Yes

Site plan attached Yes Photograph attached Yes

Intended water supply Rainwater

Expected wastewater 720

quantity (litres/day) (5 bedroom dwelling, potentially housing 6

occupants generating design flows of 120L/person/day = 720 litres/day)

**Local experience** Aerated wastewater treatment systems

provide adequate treatment of effluent on

appropriate soils.

## SITE ASSESSMENT

Climate Warm to hot summers with a high evaporative deficit. Cool to

cold winters with a small evaporative deficit

Where appropriate:

Rainfall water balance calculated Yes
Land application area calculated Yes
Wet weather storage area calculation attached NA

Flood potential:

Land application area above 1 in 20 year flood level

Land application area above 1 in 100 year flood level

Yes
Electrical components above 1 in 100 year flood level

Yes

**Exposure** Well exposed with minimal shade

Slope Linear planar Landform Mid-slope

**Run-on** See management prescriptions

Seepage None

**Erosion Potential** Slight with adequate vegetation

Site Drainage Imperfectly drained

Fill None

Groundwater:

Horizontal distance to groundwater well

used for domestic water supply >250m

Groundwater vulnerability map referred to Yass LEP 2013

Sheet CL2\_005

Vulnerability rating Not within

vulnerability area

Bores in the area and their purpose Stock & domestic

**Buffer distance from wastewater management system to:** 

Perennial watercourses

Drainage lines

Some Driveway

NA

>40m

>6m

>6m

Swimming pools

>6m

Dwelling >15m surface irr. >6m subsurface irr.

Is there sufficient land area for:

Application system (including buffer distances)

Reserve application system (including buffer distances)

Yes

Surface rocks

None

## SOIL ASSESSMENT

Depth to bedrock or hardpan >100cm Depth to soil water table >100cm

Hydraulic loading rate Soil structure

Moderately structured topsoil Moderately structured subsoil

Soil texture Clay loam topsoil

Clay loam to light clay subsoil

Permeability category (4) 0.5-1.5m/day in topsoil

(5) 0.06-0.12m /day in subsoil

Hydraulic loading recommended

for irrigation system

1.9mm/day irrigation

Coarse Fragments 5% to 10mm in topsoil

20% to 20mm in B<sub>1</sub> subsoil

Bulk Density Estimate 1.4 in topsoil

Estimate 1.3 in subsoil

Ph (1:5 Water) Topsoil 5.1

Subsoil 5.6

Electrical conductivity (dS/m) Topsoil .02

Subsoil .02

**Geology & soil landscape survey** 

Presence of discontinuities
Presence of fractured rock
Soil landscape reference

None None Bywong

**Dispersiveness** Slight in remoulded topsoil EAT 3(1)

Slight in remoulded B<sub>1</sub> subsoil EAT 3(1)

#### SYSTEM SELECTION

Consideration of connection to a centralised sewerage system

Nearest feasible connection point

Potential for future connection to centralised sewerage

None

Potential for future connection to reticulated water

None

## Type of land application system best suited to site:

Surface or shallow subsurface irrigation

**Reason** As prescribed in subdivision land capability

assessment

## Type of treatment system best suited to site and application system:

Aerated wastewater treatment system

**Reason** As prescribed in subdivision land capability

assessment

## **GENERAL COMMENTS**

Are there any specific environmental constraints?

None

## Are there any specific health constraints?

Ensure in-ground water tanks are located well upslope of the effluent irrigation area.

#### MANAGEMENT PRESCRIPTIONS

Aerated wastewater treatment systems treat effluent to an improved, or secondary standard, reducing any impact on groundwater and making available water for landscaping and other purposes. The following prescriptions are site specific and must be strictly adhered to, in order to maximise water and nutrient uptake, and thus minimise runoff and seepage.

The AWTS must be accredited by NSW Health.

An irrigation area of 400 m<sup>2</sup> should be determined within the area shown as suitable in Figure 1.

The irrigation area is to be sown to improved perennial pastures, which once established, should be regularly mown to improve rates of nitrogen uptake.

The treated effluent may be applied by surface irrigation provided a 15m setback to the dwelling can be achieved. Surface sprays must be of the large droplet type that do not produce aerosols and are to be regularly rotated throughout the effluent application area to evenly spread hydraulic and nutrient loads.

The end of the distribution line from the AWTS to the effluent application area is to be fixed at the highest elevation within the irrigation area and such that the sprinkler line is constrained within the irrigation area.

The treated effluent may also be applied by sub-surface irrigation and must be done so if a 15m setback to the dwelling cannot be achieved. (Subsurface irrigation may be installed up to 6m from the dwelling)

Return flush lines to the tank should be installed to ensure flocculants in the lines are recycled back to the tank. Pressure compensating dripper heads to be used. Vacuum breakers or air release valves to be installed at highest point in irrigation field, to prevent migration of soil into irrigation lines. Irrigation laterals to be installed on the contour at 100mm depth and at nominal 1000mm spacing. A single disc filter of nominal 100mm diameter (85mm internal) to be installed upstream of irrigation system. Filter to be cleaned at quarterly service intervals.

The irrigation area must not be disturbed by any building activity such as stockpiles of excavated material or vehicle traffic.

House area runoff to be directed well clear of the effluent application area.

Livestock to be excluded from the effluent application area

Detergents should be selected for low levels of phosphorus and sodium. (See appendix 3)

Fig 1. Area suitable for effluent application

#### WATER BALANCE

A water balance model is helpful in assessing the sensitivity of the design to various input and output characteristics.

Based on a potential quantity of 720 litres/day of wastewater, spread across 400 m<sup>2</sup> of irrigation area, the effluent application rate of 1.8mm/day results in a moisture deficit in all months of the year. Importantly, the deficit is theoretical and it should be noted that saturation is possible at any time following periods of extended wet weather.

The application rate of 1.8mm/day is comparatively conservative, against the rate of 3.5mm/day for a clay loam determined from table M1 from AS1547:2012.

#### **NUTRIENT BALANCE**

The nutrient balance examines the discharge of nitrogen and phosphorus against the capacity of plants and soil to assimilate those nutrients. Excess nutrients may eventually impact upon watercourses via surface run-off or groundwater.

Nitrogen Balance										
Site Address: 5	52 Wc	odbury	Drive,	Sutton						
SUMMARY - LAND APPLICATI	ION AF	REA REQU	JIRED BA	SED NIT	ROGEN B	ALANCE			350	m <sup>2</sup>

Hydraulic Load		720	L/day	Crop N Upt	ake	180	kg/ha/yr	which equals	49.32	mg/m <sup>2</sup> /day
Effluent N Concentration		30	mg/L				•	•		
% N Lost to Soil Processes (Geary & Gardner 1996)		0.2	Decimal							
Total N Loss to Soil		4320	mg/day							
Remaining N Load after soil loss 17			mg/day							
NITROGEN BALANCE BASED	ON AN	NUAL CR	OP UPTA	KE RAT	ES					
finimum Area required with zero buffer Determination of Buffer Zone Size for a Nominated Land Application Area (LA								A)		
Nitrogen	350	m <sup>2</sup>	Nominated L	AA Size			400	m <sup>2</sup>		
			Predicted N	Export from	LAA		-0.89	kg/year		
			Minimum Bu	ffer Require	for excess nu	utrient	0	m <sup>2</sup>		

720 litres/day wastewater quantity at 30mg/l total N concentration = 7.9 kg Nitrogen discharged per year, applied over an irrigation area of 400 m<sup>2</sup> = 198 kg/ha/yr.

A mix of existing native and improved grasses should provide a rate of nitrogen uptake of around 180kg/ha/yr at this location.

Total nitrogen loss to soil processes should account for 39kg/ha/yr. Therefore the discharge of nitrogen should be balanced by plant uptake and soil processes.

## **Phosphorus Loading**

720 litres/day wastewater quantity at 10 mg/l of P

- = 2.6kg P discharged per year, applied over an irrigation area of 400m<sup>2</sup>
- = 65 kg/ha/yr.

Native & improved grasses should provide a rate of P uptake of around 20kg/ha/yr.

Balance of 45kg/ha/yr. applied to P sorption capacity of soil;

P sorption capacity of in-situ soil 5400kg/ha. <sup>1</sup>

Lifetime of irrigation area 120 years in terms of P sorption capacity.

<sup>1</sup> SCA "Design and Installation of On-site Wastewater Systems", P. Sorption Uptake Values (Typical)

## LAUNDRY PRODUCTS RESEARCH

Laundry products were purchased by *Lanfax Labs* from supermarkets in Armidale, NSW and a number of boutique products were provided by manufacturers. A total of 41 liquids and 54 powders were tested by mixing each product at the manufacturer's recommended dose for either front loading or top loading automatic washing machines. The dose was calculated at the full cycle load, that is 75 L for front loaders and 150 L for top loaders. The full cycle accounts for the water used in the wash, spin, rinse, deep rinse and spin rinse cycle. The quantities of 75 L for front loaders and 150 L for top loaders were taken from averaged rates for those machines (Patterson, 2004).

Each sample was mixed with cold (20°C) deionised water (to replicate good quality rainwater). Where town water supplies are used, the values reported for sodium concentrations may increase because of sodium in the reticulated water – that will vary from location to location, usually higher in inland than coastal towns. Each sample was shaken for 30 minutes to replicate the washing action.

The concentrations of sodium and phosphorus (and other elements) were measured on the samples using Inductively Coupled Plasma (ICP) technology in accordance with current Good Laboratory Practices at Lanfax Labs.

Only sodium (g/wash) and phosphorus (mg/L) are reported in the graphs presented here.

Additional information on this unique research may be obtained at: www.lanfaxlabs.com.au/laundry.htm

Other papers on laundry detergents can be found at: www.lanfaxlabs.com.au/publications.html

## HOW TO READ THE GRAPHS

Each product is represented by two bars: the top bar (if present) shows the phosphorus concentration (mg/L); while the lower bar shows the sodium load (g/wash). The graph is arranged in ranked order of sodium load. Figure F1 is for 54 detergents at the front loader rate, Figure T1 is for 89 detergents at the top loader rate.

#### Sodium Load

For all on-site systems that apply the effluent by surface or subsurface application, the levels of sodium in the discharge are critical to long term absorption. Choose the product with the lowest sodium load (g/wash). Levels above 20 g/wash are likely to be detrimental to plants and the soil although plant tolerance and soil types will vary. The shorter the bar, the lower the load. When in doubt, choose the lower sodium load.

The detergents with long sodium bars (greater than 20 g/wash) should not be thrown onto your favourite garden as the sodium may be detrimental to the plants. High pH (see the website for pH data) is also detrimental to plants and soil. The pH of liquids (average pH 8) is generally lower than pH of powder detergents (average pH 10.5).

#### **Phosphorus Concentration**

The choice of a suitable level of phosphorus in the greywater (laundry water discharge) will depend upon the soil type and the use of the effluent. In some soils, phosphorus is not a real concern because of the natural ability of the soil to immobilize the phosphorus and limit its leaching from the disposal site. In other soils, phosphorus is likely to build up to high levels and leach from the soil. It is preferable to choose the lower phosphorus values as well as the low sodium values. The load of phosphorus for each product is available in the website data.

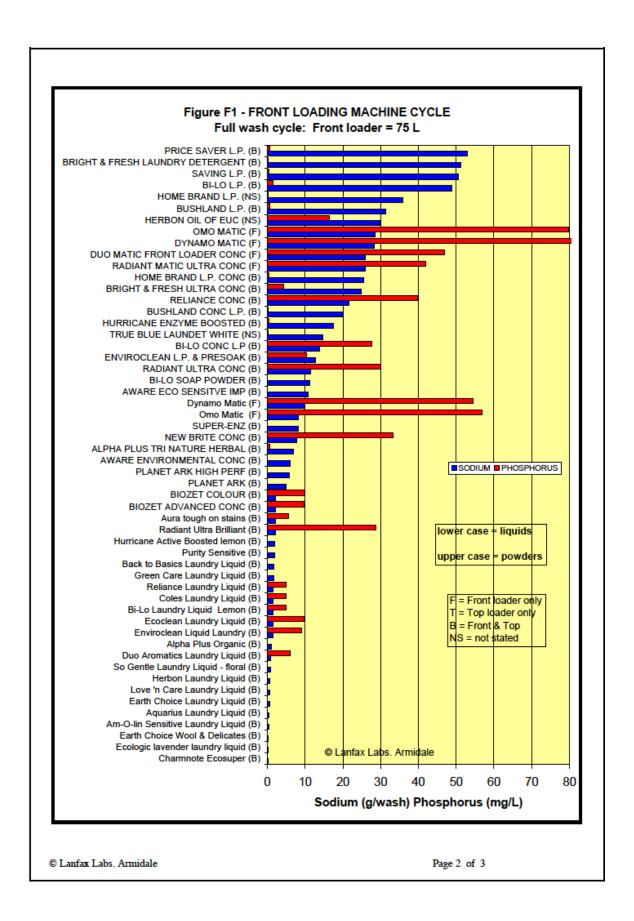

#### ©Copyright Restriction

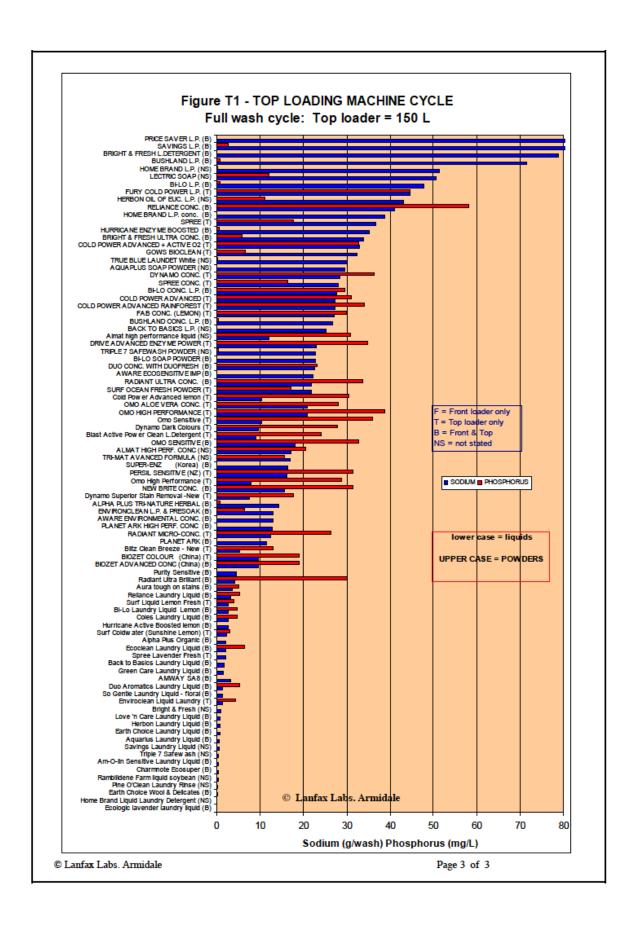

This material may only be reproduced in full (three pages) for educational purposes. None of the graphs should be construed as an endorsement of one product over another, or that one product is superior or inferior to another. The data are presented as measurements of fact, ranked in order of sodium.

This research was funded by Lanfax Labs and was independent of any manufacturer or other organisation.

Caution: Formulations may have changes since these products were purchased in 2005.
