FENCE COMPLIANCE NOTES:

THE STANDARDS THAT FENCES MUST NEED TO BE BUILT WITHOUT PLANNING OR BUILDING APPROVAL IN RESIDENTIAL ZONES.

TO BE EXEMPT, FENCES MUST MEET THESE DEVELOPMENT REQUIREMENTS:
• SIDE AND REAR BOUNDARY FENCES MUST NOT BE HIGHER THAN 1.8 M, OR HIGHER THAN 1.2 M IF THE FENCE IS BUILT FROM MASONRY.
• FENCES ALONG A BOUNDARY OF, OR IN THE SETBACK AREA OF, A PRIMARY OR SECONDARY ROAD MUST NOT BE TALLER THAN 1.2 M (THIS INCLUDES THE FRONT OF THE SITE AND ANY SIDE BOUNDARY ON CORNER SITES).
• FENCES ALONG THE BOUNDARY WITH, OR WITHIN THE SETBACK AREA TO A SECONDARY ROAD MUST: O BE AT LEAST 20% TRANSPARENT, ABOVE 400 MM. O NOT HAVE SOLID PIERS OR POSTS WIDER THAN 350 MM.
• CORNER SITES CAN, HOWEVER, HAVE SOLID FENCES UP TO 1.8 M IN HEIGHT ALONG THE REAR 50% OF THE SECONDARY FRONTAGE

Building Specification

These are the specifications upon which the certified NatHERS assessment is based. Any deviation from these specifications will invalidate the NatHERS certificate and therefore voids compliance of the development with the NCC and the NSW BASIX Protocol. In case of any variation from these specifications contact Senica Consultancy Group to obtain updated NatHERS and BASIX certificates and an updated copy of these specifications.

(1) A stairway must be designed to take loading forces in accordance with AS/NZS 1170.1 and must have—

(a) not more than 18 and not less than 2 *risers* in each *flight*; and

(b) *goings* (G), *risers* (R) and a slope relationship quantity (2R + G) in accordance with Table 11.2.2a, except as permitted by (2) and (3); and

(c) constant *goings* and *risers* throughout each *flight*, except as permitted by (3) and (4), and the dimensions of *goings* (G) and *risers* (R) in accordance with (1), (2) and (3) are considered constant if the variation between—

(i) adjacent *risers*, or between adjacent *goings*, is not more than 5 mm; and

(ii) the largest and smallest *riser* within a *flight*, or the largest and smallest *going* within a *flight*, is not more than 10 mm; and

(d) *risers* which do not have any openings that would allow a 125 mm sphere to pass through between the treads; and

(e) treads of solid construction (not mesh or other perforated material) if the stairway is more than 10 m high or connects more than 3 storeys.

(2) In the case of a stairway serving only non-*habitable rooms*, such as attics, storerooms and the like that are not used on a regular or daily basis—

(a) the *going* (G), *riser* (R) and slope relationship quantity (2R + G) in accordance with Table 11.2.2a may be substituted with those in Table 11.2.2b; and

(b) need not comply with (1)(d).

(4) The point of measurement of the *going* (G) in the slope relationship quantity (2R + G) for *tapered treads* and treads in *spiral stairways* as described in Table 11.2.2a (see Figure 11.2.2a, Figure 11.2.2b and Figure 11.2.2c) must be—

(a) for *tapered treads*, other than treads in a *spiral stairway*—

(i) not more than 1 m in width, the middle of the unobstructed width of the stairway (see Figure 11.2.2b); and

(ii) more than 1 m in width, 400 mm from the unobstructed width of each side of the stairway (see Figure 11.2.2c); and

(b) for treads in *spiral stairways*, the point seven tenths of the unobstructed width from the face of the centre pole or support towards the handrail side (see Figure 11.2.2d and Figure 11.2.2e).

(5) *Riser* and *going* dimensions must be measured in accordance with Figure 11.2.2f.

Table 11.2.2a Riser and going dimensions (mm)

Stair type	*Riser* (R) (see Figure 11.2.2f)		*Going* (G) (see Figure 11.2.2f)		Slope relationship (2R+G)	
	Max	Min	Max	Min	Max	Min
Stairs (other than spiral)	190	115	355	240	700	550
Spiral	220	140	370	210	680	590

Explanatory information: Not more than 18 and not less than 2 risers

11.2.2(1)(a) states that a stairway must have not more than 18 and not less than 2 *risers* in each *flight*. Where there are less than 2 *risers* in a *flight*, it

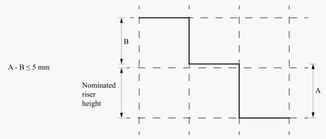
Explanatory information: Going and riser dimensions

The purpose of 11.2.2 is to achieve constant *going* and *riser* dimensions deemed safe for people to walk up and down. This minimises the risk of people overstepping during descent on uneven stairs (due to short *goings*) and tripping on ascent (due to high *risers*). Table 11.2.2a and Table 11.2.2b express ratios between *going* and *riser* dimensions which are considered safe for use. 11.2.2(1)(c) accounts for conditions such as movement of materials due to atmospheric moisture changes or minor deviations related to variations in materials which affect finished stair dimensions.

Explanatory Figure 11.2.2a illustrates adjacent *risers* within a *flight* with minor deviations in the materials affecting the finished stair dimensions. The nominated *riser* height is exceeded by *riser* A. As a consequence *riser* height B is less than the nominated *riser* height. The difference between *riser* A and *riser* B cannot exceed 5 mm.

Explanatory Figure 11.2.2b illustrates an entire *flight* with minor deviations in the materials affecting the finished *riser* dimensions. In addition to the 5 mm difference permitted between adjacent *goings* or *risers*, the maximum difference between the smallest and largest *going* or *riser* within a *flight* must not exceed 10 mm. Despite the deviations shown in both diagrams, the stairs in the *flight* are deemed constant. Irrespective of any minor deviations permitted by 11.2.2(1)(c), finished *going* and *riser* dimensions must not exceed the limitations stipulated in Table 11.2.2a.

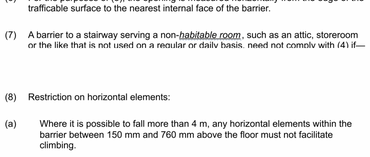
Figure 11.2.2a (explanatory) Minor deviations in a stairway — deviation in adjacent risers



▼ Figure Notes

1. A = larger *riser* of two adjacent *risers*.
2. B = smaller *riser* of two adjacent *risers*.
3. This diagram only shows deviations in *risers*, however the same principle can apply for *goings*.

Figure 11.2.2b (explanatory) Minor deviations in a stairway – deviations over a flight



▼ Figure Notes

1. C = largest *riser* of the *flight*.
2. D = smallest *riser* of the *flight*.
3. This diagram only shows deviations in *risers*, however the same principle can apply for *goings*.

Explanatory information: Openings in stair risers

11.2.2(1)(d) allows the use of open *riser* stairs. However, it limits the openings to 125 mm to minimise the risk of a person (especially a young child) falling through the opening created by the open *riser*.

Explanatory information: Stairways with winders

- 11.2.2(3) allows the use of *winders* in stairways. However, 11.2.2(3) places a restriction on the number of allowable *winders* in a stairway *flight*, this restriction would apply equally to not permit a stairway incorporating a consecutive series of *winders* in a *flight*.
- This also means the maximum number of consecutive *winders* in any stairway

11.3.4 Construction of barriers to prevent falls

(1) A barrier *required* by 11.3.3[14] must comply with (2) to (11).

(2) The height of a barrier must be in accordance with the following:

(a) The height must not be less than 865 mm above the nosings of the stair treads, the floor of a ramp or the like (see Figure 11.3.4a).

(b) The height must not be less than—

(i) 1 m above the floor of any *landing*, corridor, hallway, balcony, deck, verandah, access path, *mezzanine*, access bridge, roof top space or the like to which general access is provided (see Figure 11.3.3b and Figure 11.3.4a); or

(ii) 865 mm above the floor of a *landing* to a stairway or ramp where the barrier is provided along the inside edge of the *landing* and does not exceed a length of 500 mm.

(3) A transition zone may be incorporated where the barrier height changes from 865 mm on the stairway *flight* or ramp to 1 m at the *landing* (see Figure 11.3.4b).

(4) Openings in barriers (including decorative balustrades) must be constructed so that they do not permit a 125 mm sphere to pass through it and for stairways, the opening is measured above the nosing line of the stair treads (see Figure 11.3.4a).

(5) Where a *required* barrier is fixed to the vertical face forming an edge of a *landing*, balcony, deck, stairway or the like, the opening formed between the barrier and the face must not exceed 40 mm.

(6) For the purposes of (5), the opening is measured horizontally from the edge of the trafficable surface to the nearest internal face of the barrier.

(7) A barrier to a stairway serving a non-*habitable room*, such as an attic, storeroom or the like that is not used on a regular or daily basis, need not comply with (4) if—

(8) Restriction on horizontal elements:

(a) Where it is possible to fall more than 4 m, any horizontal elements within the barrier between 150 mm and 760 mm above the floor must not facilitate climbing.

(b) For the purpose of (a), the 4 m is measured from the floor level of the trafficable surface to the surface beneath.

(9) A barrier constructed of wire is deemed to meet the requirements of (4) if it is constructed in accordance with 11.3.6[15].

(10) A glass barrier or *window* serving as a barrier must comply with H1D8[16] and the relevant provisions of this Part.

(11) A barrier, except a *window* serving as a barrier, must be designed to take loading forces in accordance with AS/NZS 1170.1.

Figure 11.3.4a Barrier construction

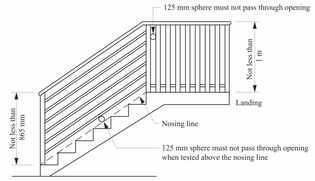


Figure 11.3.4b Measuring heights for barriers and handrails and where transition zones are allowed

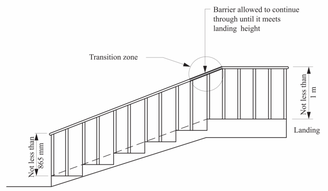

Explanatory information

For a *window* forming part of a barrier, any horizontal elements such as a *window* sill, transom or rail between 150 mm and 760 mm above the floor is deemed to facilitate climbing.

Section 8 contains the glazing assembly provisions for glass barriers and

11.3.3 Barriers to prevent falls

(1) A continuous barrier must be provided along the side of a trafficable surface, such as—

(a) a stairway, ramp or the like; and

(b) a floor, corridor, hallway, balcony, deck, verandah, *mezzanine*, access bridge or the like; and

(c) a roof top space or the like to which general access is provided; and

(d) any delineated path of access to a building,

where it is possible to fall 1 m or more measured from the level of the trafficable surface to the surface beneath (see Figure 11.3.3a).

(2) The requirements of (1) do not apply to—

(a) a retaining wall unless the retaining wall forms part of, or is directly associated with, a delineated path of access to a building from the road, or a delineated path of access between buildings (see Figure 11.3.3b); or

(a) Barrier not required (b) Barrier required

Explanatory information: Intent

The intent of the barrier requirements is to prescribe provisions to minimise the risk of a person falling from a stairway, raised floor level (such as a balcony) or the like. 11.3.3 sets out when barriers are *required* to be provided and 11.3.4[13] contains the requirements for the construction of barriers.

Explanatory information: Barriers and children

Children are at particular risk of falling off, over or through ineffectively designed or constructed barriers. Accordingly the requirements of this Part aim to ensure that a barrier reduces the likelihood of children being able to climb over a barrier or fall through a barrier.

11.3.5 Handrails

(1) Handrails to a stairway or ramp must—

(a) be located along at least one side of the stairway *flight* or ramp; and

(b) be located along the full length of the stairway *flight* or ramp, except in the case where a handrail is associated with a barrier the handrail may terminate where the barrier terminates; and

(c) have the top surface of the handrail not less than 865 mm and not more above the nosings of the stair treads or the floor surface of the ramp (see Figure 11.3.4b); and

(d) be continuous and have no obstruction on or above them that will tend to break a handhold, except for newel posts, ball type stanchions, or the like.

(2) The requirements of (1) do not apply to—

(a) a stairway or ramp providing a change in elevation of less than 1 m; or

(b) a *landing*; or

(c) a *winder* where a newel post is installed to provide a handhold.

Explanatory information

(a) 11.3.5 addresses requirements regarding location, height and extent of handrails. Where a barrier and handrail are installed together, 11.3.5 is to be read in conjunction with 11.3.3[17], 11.3.4[18] and 11.3.6[19].

(b) A handrail is *required* on at least one side of the stairway *flight* or ramp. The top rail of a barrier may be suitable as a handrail if it meets 11.3.5 and is able to be grasped by hand to provide support to the person using the stairway or ramp.

(c) 11.3.5(1)(b) requires a continuous handrail which must extend the full length of the stairway *flight* or ramp except where the handrail is associated with the barrier, in which case the handrail can terminate where the barrier is allowed to terminate. This allows for the barriers to geometric stairways such as elliptical, spiral, circular or curved stairways to finish a few treads from the bottom of the stairway.

(d) 11.3.5(1)(c) requires a minimum handrail height of 865 mm. This height provides comfort, stability, support and assistance for most users.

(e) 11.3.5(2) outlines where a handrail need not be provided, this includes—

(i) where a stairway or ramp is providing a change in elevation less than 1 m; or

(ii) a *landing* for a stairway or ramp; or

(iii) a *winder* in a stairway if a newel post is installed to provide a handhold.

NOT FOR CONSTRUCTION

2.2 Shower classification

2.2.1 Enclosed showers

For an enclosed shower, the shower screen shall be designed and installed to prevent the spread of water from the Category 1 area.

2.2.2 Unenclosed showers

2.2.2.1 General

An unenclosed shower shall include —

(a) Type 1 —

(i) a frameless shower screen, unless the shower screen is fitted with seals and deflectors, all of which control the spread of water from the shower area; or

(ii) a shower over bath with up to 900 mm fixed glass screen.

(b) Type 2 —

(i) a shower area with a curtain;

(ii) a shower over bath with curtain;

(iii) a shower area with no curtain; or

(iv) an area where a shower screen partitions one side of the shower, the entry to the shower is open, and the spray from the rose can still exit the shower past the screen 1 500 mm.

2.3 Requirements for fall

2.3.1 Falls in substrate

Where a floor waste is required in a wet area, the membrane shall be applied to a substrate with a minimum 1:100 fall towards the floor waste.

NOTE This requirement is intended to avoid ponding on the substrate.

2.3.2 Falls in shower area floor finishes (Category 1)

The fall to the floor waste in a shower area shall be a minimum of 1:80.

2.3.5 Whole of bathroom designed as an unenclosed shower

In a whole bathroom designed as an unenclosed shower without a shower screen installed, the floor substrate under the membrane shall have a minimum 1:80 fall.

3.3.2 Water-resistant substrates

For the purposes of this Standard, the following materials used in waterproofing systems, in conjunction with water-resistant surface materials in accordance with Clause 3.3.3, are deemed to be water resistant:

(a) Walls:

(i) Concrete in accordance with AS 3600.

(ii) Cement render.

(iii) Fibre cement sheeting manufactured in accordance with AS/NZS 2908.2.

(iv) Water-resistant plasterboard sheeting manufactured in accordance with AS/NZS 2588.

(v) Masonry in accordance with AS 3700.

(vi) Structural plywood manufactured in accordance with AS/NZS 2269 (series), and installed in accordance with AS 1684.2, AS 1684.3 and AS 1684.4.

(b) Floors:

(i) Concrete in accordance with AS 3600 and AS 2870.

(ii) Compressed fibre cement sheeting manufactured in accordance with AS/NZS 2908.2.

(iii) Fibre cement sheeting manufactured in accordance with AS 2908.2, and supported on a structural floor.

(iv) Structural plywood manufactured in accordance with AS/NZS 2269 (series), and installed in accordance with AS 1684.2, AS 1684.3 and AS 1684.4.

The substrate material shall not degrade when exposed to moisture.

3.7 Adhesives

Adhesives used in a waterproofing system shall be —

(a) waterproof in accordance with AS/NZS 4858, where waterproof to waterproof materials meet; and

NOTE 1 This is particularly important at the laps of sheet membranes.

(b) compatible with the materials to which they are adhered.

4.3 Membrane to drainage connection

4.3.1 Leak control flanges

For a membrane to drainage connection, the following shall apply:

(a) The waterproofing membrane shall be bonded onto the leak control flange. The membrane shall be terminated horizontally or both horizontally and vertically.

NOTE 1 For information regarding selection and installation of leak control flanges, refer to membrane product specifications.

NOTE 2 For typical examples of membrane terminations at drainage outlets, see Figure 4.3.1(A) and Figure 4.3.1(B).

(b) Leak control flanges shall be recessed into the substrate and not protrude above it. Leak control flanges shall be sealed to the riser and be secured to the substrate to prevent movement. The diameter of the leak control flange (DN) shall match the diameter of the riser pipe (DN). The transition from leak control flange to substrate shall have a fillet sealant applied.

(c) Where a shower tray is used, provision shall be made to drain the tile bed and provide a waterproof connection to the drain.

(d) The leak control flange shall not be installed in a location that interferes with bond breakers or wall floor junctions.

NOTE 3 For an example of a generic leak control flange adjacent to a wall, see Figure 4.3.1(C).

[SOURCE: Reproduced with permission from Stormtech. All rights reserved]

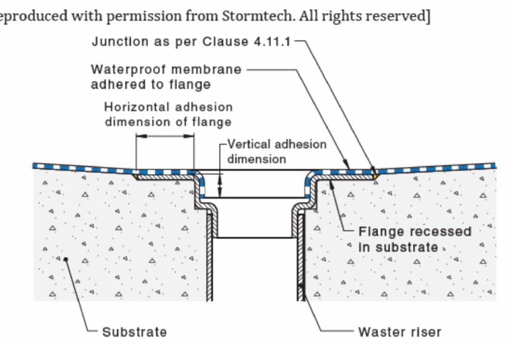

Figure 4.3.1(B) — Typical membrane termination at leak control flange with down leg

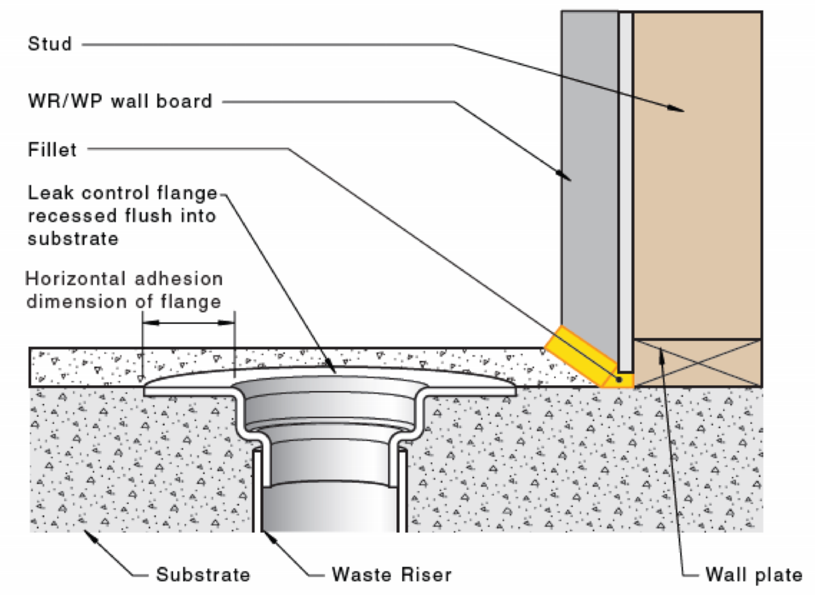

Figure 4.3.1(C) — Generic leak control flange adjacent to a wall

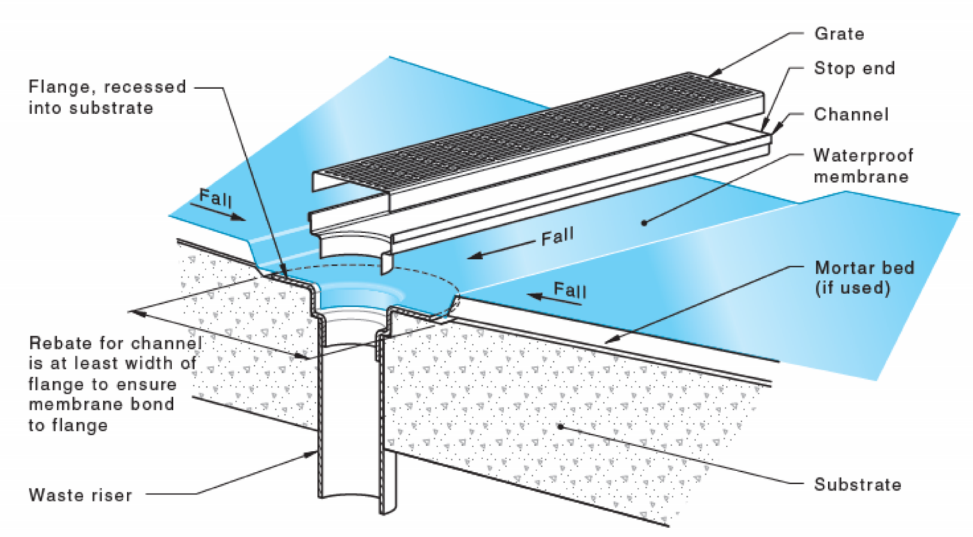
4.3.2 Linear drainage connections

The waterproof drainage shall be continuous for the membrane into the drainage outlet. Where the drainage channel does not have an integral horizontal or vertical surface of 50 mm for termination of the membrane, the membrane shall be continuous underneath the drainage channel, terminating at a recessed leak control flange.

When the drainage channels without integral flanges are installed against a wall, the installation shall conform to the waterproofing requirements of Clause 4.6.3.

NOTE See Figure 4.3.2 for an example of a linear drain with a centrally located single outlet.



NOTE Trim should not restrict substrate drainage at linear drain.

Figure 4.3.2 — Linear drain single outlet centrally located

4.4 Surface preparation

4.4.1 Surface preparation

The preparation of the substrate for membranes shall result in the surface of the substrate being smooth, without protrusions, voids or formwork distortions, and clean, dry, and free from dust and contamination.

Substrates shall be treated in order to eliminate pin-holing caused by substrate degassing during the wet film curing process, and for adhesion to the substrate.

NOTE 1 To aid in adhesion on a concrete or screeded surface, the smoothness of substrate should be at least the equivalent to that of a wood float or light broom finish. Priming may be required for some types of membrane.

NOTE 2 Refer to product specifications for guidance on appropriate treatments.

NOTE 3 All surfaces to which a waterproofing system is to be applied should be treated to improve adhesion of the membrane, with particular emphasis on liquid waterproofing systems. Cured materials should be well bonded to the substrate to prevent subsequent failure through shear, cyclical or elongation stress.

NOTE 4 Surface irregularities may be addressed by grinding, shot blasting, scarification, localized filling, self-levelling topping or any other mechanical means deemed appropriate. The importance of surface irregularities is reflected in the use of a standardized measure of concrete surface roughness known as the Concrete Surface Profile (CSP). For more information regarding CSP, refer to Appendix E of AS 1884:2021.

4.4.4 Wall sheeting preparation

Substrate sheet materials shall be mechanically fastened to the supporting structure.

NOTE 1 Substrate sheet materials should be installed in accordance with the manufacturer's instructions.

NOTE 2 Setting materials should be water resistant.

NOTE 3 Setting materials should not de-bond or de-laminate.

NOTE 4 It is recommended that fibre cement sheeting be a minimum of 6 mm.

NOTE 5 All free edges of sheet materials should be supported.

4.4.5 Render preparation

The surface of the render shall be smooth and uniform.

NOTE Guidance on rendering is provided in AS 3958.1.

4.8 Waterstops

4.8.1 General

Waterstops shall be installed to retain water within the shower area or wet area. Waterstops are an integral part of the waterproofing system and shall conform with Clauses 4.8 and 4.9.

4.8.2 Waterstop for unenclosed showers

An unenclosed shower shall incorporate a waterstop finishing at the perimeter of the shower area.

This clause sets out requirements for waterstops according to the type of unenclosed shower (see Clause 2.2.2.1) as follows:

(a) *Type 1 unenclosed showers* — A waterstop shall be placed under the splash restriction device and across the opening of the shower of a Type 1 shower screen.

NOTE 1 It is advisable to have either the screed drained, or a membrane placed on the top of the screed to prevent water retention in the screed beyond the waterstop.

NOTE 2 Type 1 unenclosed showers have a device that will restrict splashing during use.

(b) *Type 2 unenclosed showers* — The waterstop of a Type 2 shower shall be a minimum of 1 500 mm from the shower rose connection to the wall or the ceiling.

NOTE 3 See Figure 4.8.2(A) for an example of a Type 2 unenclosed shower.

NOTE 4 If using the waterstop at the door threshold for a Type 2 unenclosed shower see Clause 2.3.5.

4.8.3 Waterstops for enclosed showers

An enclosed shower shall incorporate a waterstop under the bottom rail of the shower screen and the opening. See Figure 4.8.2(B), Figure 4.8.2(C) and Figure 4.8.2(D).

4.8.4 Waterstop for enclosed showers without hobs or set-downs

At the extremity of the shower area —

(a) where a shower screen is to be installed, a waterstop shall be positioned so that its vertical leg will finish a minimum of 5 mm above the finished floor level (see Figure 4.8.4); and

(b) where the waterstop intersects with a wall or is joined, the junction shall be waterproof.

NOTE For a typical hobless construction, see Figure 4.8.4.

4.8.5 Showers located near exits to wet areas

Where the extremity of a shower area is located within 200 mm of an exit from a wet area, it shall —

(a) be an enclosed shower area as defined in Clause 1.3.31.

(b) have one of the following:

(i) A waterstop that finishes a minimum of 5 mm above the finished floor level, under the shower screen.

(ii) A hob at the extremity of the shower area.

(iii) A step-down of minimum 15 mm from the finished floor level at the extremity of the shower area.

(c) have a vertical waterstop where the shower screen abuts the wall.

NOTE It is recommended that the floor surface outside the shower area should have fall away from the exit to prevent water escaping from the wet area.

4.9 Door openings

4.9.1 Perimeter flashing at floor level openings

The following requirements apply to perimeter flashing at floor level openings:

(a) Whole wet area floor waterproofing shall incorporate —

(i) a waterstop that has a vertical leg finishing flush with the top of the finished floor level shall be installed at floor level openings; and

(ii) a floor membrane terminated to create a waterproof seal to the waterstop and to the perimeter flashing.

(b) Waterproofing other than whole wet area floor waterproofing shall incorporate a waterstop that —

(i) has a vertical leg finishing flush with the top of the finished floor level installed at floor level openings; and

(ii) is integral with the perimeter flashing.

(c) Perimeter flashing to wall, floor surfaces, and door openings shall —

(i) be continuously sealed to the horizontal surface;

(ii) have a vertical leg of a minimum of 25 mm above the finished floor level, except across doorways; and

(iii) have a horizontal leg with a minimum width of 50 mm.

(d) Waterstops at cavity sliders shall —

(i) be returned across the cavity opening; and

(ii) have a membrane applied to form a continuous perimeter flashing.

NOTE For an example of waterproofing installation, see Figure 4.9.1(B).

4.9.2 Protection of door frames and architraves

The requirements for protection of door frames and architraves are as follows:

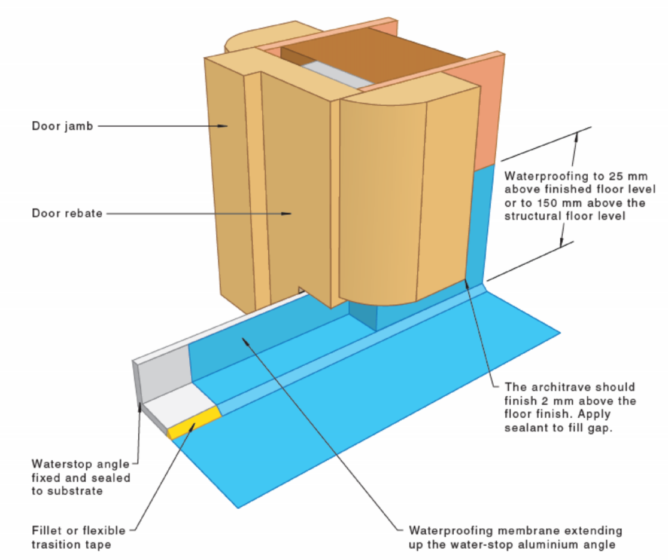
(a) Timber door frames shall not be embedded into the tiles.

(b) There shall be a sealed gap of a minimum of 2 mm between the door architrave and the floor.

(c) The underside of the door jamb and architrave shall be treated to resist moisture.

NOTE Some examples of moisture resistant treatments include paint, sealant, etc.

See examples of waterproofing installations in Figure 4.9.1(A), Figure 4.9.1(B), and Figure 4.9.1(C).



NOTE The waterstop angle may be located at the face of the door jamb or at the rebate.

Figure 4.9.1(A) — Example of liquid waterproofing at door opening framework

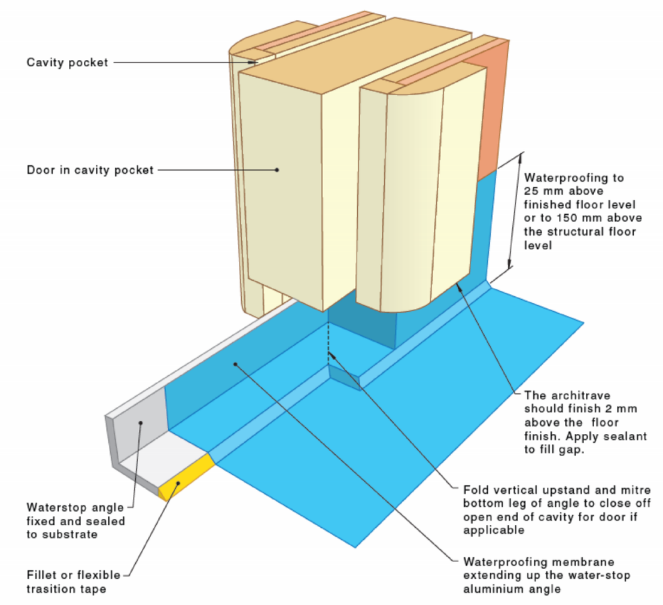


Figure 4.9.1(B) — Waterproofing at door opening cavity slider

4.10 Fillets and bond breakers — bond breaker installation for bonded membranes

At any change of plane or materials, and at movement joints, fillets or bond breakers shall be used where the membrane is bonded to the substrate. Bond breakers shall be of the type compatible with the flexibility class of the membrane to be used in accordance with Table 4.10.

NOTE 1 Typical transition tape details are shown in Figure 4.10.

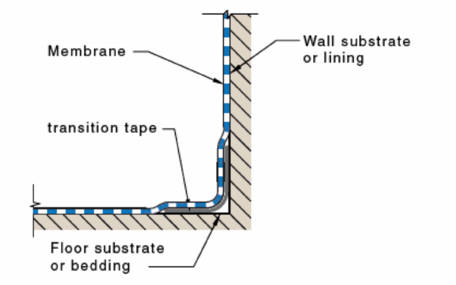
NOTE 2 Additional information on bond breakers is given in Appendix A.

NOTE 3 Fillets or bond breakers are not needed in the internal angle of waterstops.

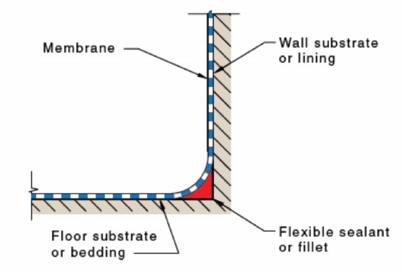
Table 4.10 — Bond breakers

Membrane class	Elongation at break	Minimum bond breaker/tape width
I	10 % to 59 %	100 mm
II	60 % to 299 %	35 mm
III	≥ 300 %	12 mm

NOTE 1 Bond breakers for Class I membranes (low extensibility) allow the membrane to flex rather than stretch.



(a) Class I or II membrane



(b) Class III membrane

Figure 4.10 — Typical transition tape details

4.11 Junctions, transitions, and terminations

4.11.1 Types of junctions, transitions, and terminations

The following list specifies the minimum requirements for the treatment for various junctions. Junctions may be either wall to floor or wall to wall. Either the floor or wall may be waterproof, water resistant or have no treatment specified.

The types of junctions that shall be used are as follows:

(a) *Type 1* — Where waterproof to waterproof surfaces meet, the waterproofing shall be continuous across the junctions and shall be deemed to be a waterproof junction.

(b) *Type 2* — Where waterproof to water-resistant surfaces meet, a bead of sealant shall be deemed to be a waterproof junction.

(c) *Type 3* — Where water-resistant to water-resistant surfaces meet, a bead of sealant shall be deemed to be a water-resistant junction.

(d) *Type 4* — Where non-water-resistant or non-waterproof surfaces meet water-resistant surfaces, a bead of sealant shall be deemed to be a water-resistant junction.

NOTE Membrane connections to barrier stops in conjunction with a junction sealant ensures a transition that maintains even, required dry film thickness (DFT).

4.11.2 Vertical flashing for shower wall junctions

Vertical flashing may be external or internal and shall terminate a minimum of 1 800 mm above the finished floor level of the shower or base of the bath or tray, or 50 mm above the shower rose, whichever is the higher.

4.11.2 Vertical flashing for shower wall junctions

Vertical flashing may be external or internal and shall terminate a minimum of 1 800 mm above the finished floor level of the shower or base of the bath or tray, or 50 mm above the shower rose, whichever is the higher.

Vertical flashing shall be used as follows:

(a) External vertical flashing may be used with external membranes systems and installed behind the wall sheeting or render, provided they have legs of sufficient width to allow the wall sheeting or render to overlap by a minimum of 30 mm. The mechanical fastening of the wall sheeting shall not penetrate the flashing.

(b) Internal vertical flashing may be used with both external and internal membrane systems, provided each leg has a minimum overlap of 40 mm to the wall sheeting or render and, where used with —

(i) internal membranes, each leg extends vertically from within the shower tray;

(ii) external membranes, each leg overlaps the top edge of the floor waterproofing system, by a minimum of 20 mm; and

(iii) preformed shower bases or baths, each leg extends to the bottom edge of the wall sheeting or render.

NOTE 1 The membrane should be terminated to a Type 2 junction sealant as per Clause 4.11.1.

NOTE 2 Where a shower rose is ceiling mounted, the membrane should terminate to the full height of the wall to a Type 3 junction sealant as per Clause 4.11.1.

NOT FOR CONSTRUCTION

4.12.1 Shower areas

Penetrations for fixtures such as taps, shower nozzles, recessed soap holders and the like, shall be waterproofed by sealing with pre-formed flange systems or a sealant. When sealing the tap body to the wall, allowance shall be made for the servicing of tap washers or ceramic disks without damaging the waterproofing or seal.

NOTE 1 Typical niche detail for shower areas is shown in Figure 4.12.4.

NOTE 2 Where shower roses are ceiling mounted, the penetration should be sealed and sheet fixings should be set with water resistant setting compounds.

NOTE 3 For mixer taps, drainage may be allowed at the base of the cover plate.

NOTE 4 Mixer taps that cannot be incorporated into a waterproofing membrane system and maintain the integrity of that waterproofing system are not addressed in this document.

Any penetrations of mechanical fixings or fastenings through surface materials shall be waterproofed.

4.12.2 Horizontal surface taps

Tap penetrations on horizontal surfaces surrounding baths and spas shall be waterproofed by sealing —

(a) with pre-formed flange systems;

(b) the tap body to the membrane; or

(c) the substrate where a membrane is not required.

Connection and sealing to tap bodies shall be treated as a Type 2 termination as per Clause 4.11.1

4.12.3 Other penetrations in Category 1 areas

Penetrations through water-resistant substrates and surface finishes shall be sealed in accordance with Clause 4.11.1.

Where fixings penetrate surfaces required to be waterproof, the flexible sealant shall be compatible with the waterproof membrane material.

4.12.4 Niches, inlaid soap holders, and footrests

The requirements for niches installed in the wall of a shower area are as follows:

(a) Niches shall be lined on all surfaces with a water-resistant substrate material in accordance with Clause 3.3.2.

(b) Internal linings of niches shall be separated from any wall linings on the opposite side of the wall.

(c) Waterproofing shall be applied to all surfaces and fillets or bond breakers shall be applied according to the membrane being used in accordance with Clause 4.10.

(d) The base of a niche shall have a minimum grade fall of 1:100 towards the shower.

4.13 Baths and spas

4.13.1 General

Baths and spas shall be supported to prevent distortion and cracking. Baths and spas that are recessed into the wall shall be installed to allow the water-resistant surface materials of the wall to pass down inside the rim of the bath or spa. The wall substrate shall be connected to the bath with a Type 2 junction sealant, as per Clause 4.11.1, compatible with the membrane.

Where a bath end wall is within a shower area, it shall be treated as a shower area wall.

NOTE 1 For typical bath/spa wall junctions, see Figure 4.13.3(A) to Figure 4.13.3(E).

When installing baths and spas, the integrity of the structure shall be maintained.

For insert baths, a waterstop shall be installed around the periphery.

NOTE 2 Where a Type 1 or 2 unenclosed shower is adjacent to a bath, it should be treated as a shower over bath.

4.13.2 Baths without showers over them

4.13.2.1 Baths without an integral upstand edge — insert baths

There shall be full waterproofing of walls around the bath to 150 mm above any shower rose connection.

4.13.2.2 Baths to be recessed into a wall with no shower over them

Baths recessed into a wall shall have an integral vertical upstand lip along the side of the bath walls to enable a waterproof junction between the bath and walls. There shall be full waterproofing of bath/wall junctions. The walls around the bath shall be water resistant to 150 mm above the bath edge.

Figures 4.13.2.2(A) to 4.13.2.2(E) show examples of baths recessed in to various wall types.

4.13.3 Baths with showers over them

4.13.3.1 Bath adjoining a Type 2 unenclosed shower

A bath installation adjoining a Type 2 unenclosed shower shall be waterproofed as a shower-over-bath installation for fitted or insert baths according to Clauses 4.13.3.2 and 4.13.3.3.

4.13.3.2 Baths recessed into a wall — fitted baths

There shall be full waterproofing of walls around the bath to 150 mm above the edge of the bath. There shall be full waterproofing to junctions and penetrations at a minimum of 1800 mm from the bath floor.

4.13.3.3 Baths without an integral upstand edge — insert baths

There shall be full waterproofing of walls around the bath to 150 mm above the edge of the bath. There shall be full waterproofing to junctions and penetrations at a minimum of 1800 mm from the bath floor.

4.13.4 Freestanding baths

The extent of waterproofing for freestanding baths with or without a shower over them shall be as for Type 2 unenclosed shower (see Clause 4.8.2 and Figure 4.8.2(A)).

4.13.5 Bath end walls abutting a shower

Where a bath end wall is within a shower area, it shall be treated as a shower area wall.

NOTE Where a Type 1 or 2 unenclosed shower is adjacent to a bath, it should be treated as a shower over bath.

4.13.6 Spa baths

When installing spa baths, the following shall apply:

(a) Waterproofing underneath spa to 150 mm vertical termination to internal spa shell.

(b) Provision of overflow to outer floor to conforming leak control flange to a maximum of 30 mm below waterproofing tanking to spa shell.

NOTE 1 Where drainage is provided under the spa, it should be at membrane level with falls to waste.

(c) Where non-proprietary access to the pump is provided, water is to be excluded from entering the access panel.

(d) Pump mountings to be sealed so as not to perforate the membrane.

(e) Provision of ventilation under spa shell to manage condensation.

(f) Where drainage is provided under the spa, provision of that drainage at membrane level with falls to waste.

NOTE 2 See Figure 4.13.6 for spa bath compartment detail at bath face.

4.15 Enclosed shower screen placement

4.15.1 Showers with hobs

The shower screen shall be installed so as to ensure it is —

(a) flush with the shower area side of the hob; or

(b) overhanging into the shower area; or

(c) inside the hob.

NOTE A self-draining sub-sill is considered to be part of the shower screen.

4.15.2 Showers with step-downs

The shower screen shall be installed so as to ensure it is —

(a) flush with the finished vertical surface of the step-down; or

(b) overhanging into the shower area; or

(c) inside the step-down of the shower area.

4.15.3 Showers without hobs or step-downs

The shower screen shall be positioned —

(a) over the top of the waterstop that defines the shower area; or

(b) inside the waterstop that defines the shower area.

4.17 Polished concrete

Waterproofing systems beneath polished concrete shall be installed in accordance with Clause 4.6, Clause 4.7, Clause 4.8, Clause 4.9, Clause 4.10, Clause 4.11 and their sub-clauses, and the following requirements:

(a) Membrane shall be protected from abrasive damage when placing and vibrating the topping concrete by installing a protective underlayment.

(b) Membrane detail to vertical surfaces and walls are to be protected against damage caused when placing and polishing the concrete and incompatible sealers.

(c) Topping concrete shall be bonded to the protective underlayment with a compatible bond coat.

NOTE Figure 4.17 shows a typical polished concrete floor installation.

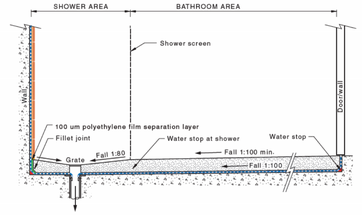

Figure 4.17 — Polished concrete floor for unenclosed shower

4.18 Floor heating

Underfloor heating cables shall not penetrate waterproofing membranes.

Underfloor heating cables shall not penetrate waterstop angles.
