- Annex B** Tabulated Soil Results
- Annex C** NATA Endorsed Laboratory Results

## 1 Introduction

### 1.1 Background

Hunter Environmental Consulting (HEC) was engaged by Hunter Civilab to conduct a preliminary material classification of soils located at East Seaham Road (here-in referred to as the Site). It is understood the purpose of this assessment is to provide the likely classification of spoil generated as part of the redevelopment works. Material is to be assessed against chemical criteria stipulated within the *Recovered Aggregate & Excavated Natural Material (ENM) Orders* (NSW Environmental Protection Authority, 2014) and to visually assess subgrade against Virgin Excavated Natural Material (VENM) definitions as referenced by The Protection of the Environment Operations Act 1997 (POEO Act).

The investigation works were undertaken in accordance with HC services agreement EQ0523, dated the 9<sup>th</sup> of May 2024.

## 2 Desktop Investigation

### 2.1 Acid Sulfate Soils Risk Maps

Review of the ePlanning (2020) Spatial Viewer online database identifies the Site as not being within an acid sulfate soils (ASS) area. Additionally, a review of the State of NSW and Department of Planning, Industry and Environment (2020) - eSPADE database identifies the material location and local surroundings fall within an area of no known ASS occurrence. Based on the Site locality, acid sulfate soils risk maps and observations in the field, ASS assessment was deemed unnecessary for this assessment.

## 3 Objectives & Scope of Work

The objective of this investigation was to assess the likely suitability of surplus material for off-site reuse opportunities or disposal requirements. The scope of works completed is characterised by the following core elements:

- Review of the ePlanning (2020) and eSPADE (2022) database to determine the presence of acid sulfate soils (already completed);
- Collection of fifteen (15) primary soil samples from the road corridor, comprising of one discrete sample per location;
- Visual assessment of underlying subgrade materials;
- Laboratory analysis of samples for and chemical properties specified in the ENM Order 2014;
- Assessment of analytical results against adopted assessment criteria.

## 4 Site Works

Site works were completed on the 28<sup>th</sup> and 29<sup>th</sup> of May 2024. Site works consisted of the advancement of twenty-eight (28) boreholes within the existing pavement. A total of fifteen (15) locations were sampled for the purposes of preliminary classification.

A soil sample log outlining the physical characteristics of the assessed material is presented below in **Table 4.1**.

**Table 4.1** - Soil sample log

Sample ID	Soil Description
BH1-BH22	Silty Sandy GRAVEL, grey/brown

A total of fifteen (15) samples were collected from pavement materials across Site. The sampling density within this investigation is not intended to meet the minimum sampling requirements of the NSW EPA ENM Order 2014 and the Recovered Aggregate Order 2014 has been conducted as a preliminary assessment only.

Samples comprised of fifteen (15) soil jars sent to a NATA accredited laboratory (SGS) sub-contracted to complete analysis specific to targeted analytes. All samples were labelled with unique identifiers referencing the sampling location and date. Soil jars were stored on ice until submission to SGS. A fresh pair of nitrile gloves were used for each sampling location.

A Site Features Plan including assessment area and sampling locations is presented as *Figure 1* of Annex A. A photographic log of the assessed material is presented below in Photograph 1.

**Photograph 1** –Existing pavement materials observed consistently throughout Site

## 5 Assessment Criteria

### 5.1 ENM Order Assessment Criteria

The ENM Order requires assessment against the following criteria:

1. Material must not be impacted by Acid Sulfate Soils (ASS).
2. Material must comprise 98% natural material by weight.
3. Material must satisfy analytical criteria as presented in **Table 5.1** below.

**Table 5.1 - ENM Analytical Criteria**

Chemicals and other attributes	Max average concentration for characterisation (mg/kg 'dry weight' unless otherwise specified)	Absolute max concentration (mg/kg 'dry weight' unless otherwise specified)
Mercury	0.5	1
Cadmium	0.5	1
Lead	50	100
Arsenic	20	40
Chromium (total)	75	150
Copper	100	200
Nickel	30	60
Zinc	150	300
Electrical Conductivity	1.5 dS/m	3 dS/m
pH *	5 to 9	4.5 to 10
Total Polycyclic Aromatic Hydrocarbons (PAHs)	20	40
Benzo(a)pyrene	0.5	1
Benzene	NA	0.5
Toluene	NA	65
Ethyl-benzene	NA	25
Xylene	NA	15
Total Petroleum Hydrocarbons C <sub>10</sub> -C <sub>36</sub>	250	500
Rubber, plastic, bitumen, paper, cloth, paint, and wood	0.05%	0.10%

## 5.2 Recovered Aggregate Order Assessment Criteria

**Table 5.2 – Recovered Aggregate Analytical Criteria**

Chemicals and other attributes	Max average concentration for characterisation (mg/kg 'dry weight' unless otherwise specified)	Max average concentration for routine testing (mg/kg 'dry weight' unless otherwise specified)	Absolute max concentration (mg/kg 'dry weight' unless otherwise specified)
Mercury	0.5	Not required	1
Cadmium	0.5	0.5	1.5
Lead	75	75	150
Arsenic	20	Not required	40
Chromium (total)	60	60	120
Copper	60	60	150
Nickel	40	Not required	80
Zinc	200	200	350
Electrical Conductivity	1.5 dS/m	1.5 dS/m	3 dS/m
Metal	1%	1%	2%
Plaster	0.25%	0.25%	0.5%
Rubber, plastic, bitumen, paper, cloth, paint, and wood	0.2%	0.2%	0.3%

## 5.3 VENM Definitions

The Protection of the Environment Operations Act 1997 defines VENM as natural material (such as clay, gravel, sand, soil or rock fines):

- that has been excavated or quarried from areas that are not contaminated with manufactured chemicals or process residues, as a result of industrial, commercial, mining or agricultural activities;
- that does not contain any sulfidic ores or soils or any other waste.

## 6 Analytical Results

Results of the chemical analysis were assessed against criteria defined in Table 4 of the *ENM Order 2014* and Table 1 of the Recovered Aggregate Order 2014 a tabulated summary of this assessment is presented in **Annex B**. In summary:

- Heavy Metals were reported accepted within ENM/Recovered Aggregate Order assessment criteria;
- PAH, TRH and BTEX were reported acceptable within ENM Order assessment criteria;
- Electrical conductivity was reported acceptable within ENM/Recovered Aggregate assessment criteria; and
- pH was reported within acceptable ranges

## 6.1 Material Management Options

A summary of the preliminary material classifications and potential management options is presented below in **Table 4.2**

**Table 6.2 – Preliminary Material Classification Assessment**

<b>Material Identification</b>	Fill (pavement) materials were observed across the site to depths of up to 1.2m BGL. Pavement materials consisted of Silty Sandy GRAVEL.  Subgrade was observed from depths of 0.1m to 1.3m BGL. Subgrade materials consisted of Silty Sandy Clay.
<b>Material Description</b>	<b>Topsoils</b> - Silty Sandy CLAY, brown, with organics  <b>Pavement Materials</b> - Silty Sandy GRAVEL, grey/brown  <b>Subgrade</b> - Silty Sandy CLAY, brown / orange, stiff to very stiff
<b>Preliminary Classification (subject to further analysis)</b>	<b>Pavement Materials/Topsoil</b> – ENM or Recovered Aggregate <b>Subgrade</b> – VENM

## 6.2 Quality Assurance / Quality Control

Quality assurance measures for environmental sampling within this ENM assessment were adopted to provide confidence in the analytical results to support determinations on material categorisation and to facilitate satisfaction of project-specific objectives. Adopted measures included complimentary regimes of field and laboratory-based quality assurance techniques and quality control sampling/analysis. Quality assurance measures, results and implications for data quality associated with this assessment is broadly defined within the following categories:

- Sample collection, storage transport and analysis
- Laboratory quality control procedures and results
- The occurrence of apparently unusual and anomalous results

Tabulated assessments of laboratory quality control samples are presented within **Annex C**. In summary, the analytical data is considered sufficiently complete, representative, comparable, accurate and precise to serve as an adequate basis for interpretation for the purposes of this project.

## 7 Conclusion

HEC was engaged by Hunter Civilab to assess the suitability of in-situ material at East Seaham Road for preliminary waste classification of in-situ materials for proposed disposal/reuse options.

The assessment included a desktop review of available information (i.e., acid sulfate risk maps) a visual inspection of soil at the Site and a collection of fifteen (15) primary samples for analysis.

Pavement materials within the road corridor was reported acceptable against ENM and Recovered Aggregate Order assessment criteria. Additional testing in accordance with the specified sampling densities and testing attributes will be necessary to satisfy the respective recovery order requirements. These materials were also found to be acceptable within threshold criteria of CT1 for General Solid Waste as specified in the *NSW Waste Classification Guidelines (2014)*.

Subgrade materials within the road corridor were deemed acceptable for classification as VENM and are therefore suitable for offsite reuse or disposal under this classification.

## 8 Report Limitations

HEC considers that the objectives of the original scope as presented in quote EQ0523 of the investigation have been achieved.

The analytical data and recommendations within the above report are subjected to the specific sampling and testing that was undertaken at the time of the current investigation. It should be noted that underlying site soil conditions can vary significantly across a site and the environment can change over time. If conditions encountered during intrusive works are different to those contained in this report HEC should be contacted immediately for site reassessment.

Any and all previous report versions for E0208-MMO-001 are superseded by this report.

If you have any further questions about this report, please contact the undersigned.

## Annex C

## ANALYTICAL REPORT

Accreditation No. 2562

### CLIENT DETAILS

Contact **Result**  
Client HUNTER ENVIRONMENTAL CONSULTING PTY LTD  
Address PO BOX 3127  
THORNTON NSW 2322

Telephone 61 2 49661844  
Facsimile (Not specified)  
Email Results@hunterenviro.com.au

Project **E0208 (Seaham)**  
Order Number **HEC0407**  
Samples 15

### LABORATORY DETAILS

Manager Huong Crawford  
Laboratory SGS Alexandria Environmental  
Address Unit 16, 33 Maddox St  
Alexandria NSW 2015

Telephone +61 2 8594 0400  
Facsimile +61 2 8594 0499  
Email au.environmental.sydney@sgs.com

SGS Reference **SE266094 R0**  
Date Received 31/5/2024  
Date Reported 7/6/2024

### COMMENTS

Accredited for compliance with ISO/IEC 17025 - Testing. NATA accredited laboratory 2562(4354).

### SIGNATORIES

Akheeqar BENIAMEEN

Chemist

Bennet LO

Senior Chemist

Dong LIANG

Metals/Inorganics Team Leader

Kamrul AHSAN

Senior Chemist

Ly Kim HA

Organic Section Head

Shane McDERMOTT

Inorganic/Metals Chemist

Ying Ying ZHANG

Laboratory Technician

**AN002**

The test is carried out by drying (at either 40°C or 105°C) a known mass of sample in a weighed evaporating basin. After fully dry the sample is re-weighed. Samples such as sludge and sediment having high percentages of moisture will take some time in a drying oven for complete removal of water.

**AN040/AN320**

A portion of sample is digested with nitric acid to decompose organic matter and hydrochloric acid to complete the digestion of metals. The digest is then analysed by ICP OES with metals results reported on the dried sample basis. Based on USEPA method 200.8 and 6010C.

**AN040**

A portion of sample is digested with Nitric acid to decompose organic matter and Hydrochloric acid to complete the digestion of metals and then filtered for analysis by AAS or ICP as per USEPA Method 200.8.

**AN101**

pH in Soil Sludge Sediment and Water: pH is measured electrometrically using a combination electrode and is calibrated against 3 buffers purchased commercially. For soils, sediments and sludges, an extract with water (or 0.01M CaCl<sub>2</sub>) is made at a ratio of 1:5 and the pH determined and reported on the extract. Reference APHA 4500-H+.

**AN106**

Conductivity and TDS by Calculation: Conductivity is measured by meter with temperature compensation and is calibrated against a standard solution of potassium chloride. Conductivity is generally reported as µmhos/cm or µS/cm @ 25°C. For soils, an extract of as received sample with water is made at a ratio of 1:5 and the EC determined and reported on the extract, or calculated back to the as-received sample. Salinity can be estimated from conductivity using a conversion factor, which for natural waters, is in the range 0.55 to 0.75. Reference APHA 2510 B.

**AN312**

Mercury by Cold Vapour AAS in Soils: After digestion with nitric acid, hydrogen peroxide and hydrochloric acid, mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500

**AN403**

Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36 and in recognition of the NEPM 1999 (2013), >C10-C16 (F2), >C16-C34 (F3) and >C34-C40 (F4). F2 is reported directly and also corrected by subtracting Naphthalene (from VOC method AN433) where available.

**AN403**

Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Recoverable Hydrocarbons - Silica (TRH-Si) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with differential polarity of the eluent solvents .

**AN403**

The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependent on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.

**AN420**

(SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols (etc) in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).

Total PAH calculated from individual analyte detections at or above the limit of reporting .

**AN420**

Carcinogenic PAHs may be expressed as Benzo(a)pyrene equivalents by applying the BaP toxicity equivalence factor (NEPM 1999, June 2013, B7). These can be reported as the individual PAHs and as a sum of carcinogenic PAHs. The sum is reported three ways, the first assuming all <LOR results are zero, the second assuming all < LOR results are half the LOR and the third assuming all <LOR results are the LOR.

**AN433**

VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.

## FOOTNOTES

*	NATA accreditation does not cover the performance of this service.	-	Not analysed.	UOM	Unit of Measure.
**	Indicative data, theoretical holding time exceeded.	NVL IS	Not validated. Insufficient sample for analysis.	LOR ↑↓	Limit of Reporting. Raised/lowered Limit of Reporting.
***	Indicates that both * and ** apply.	LNR	Sample listed, but not received.		

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.  
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.

Note that in terms of units of radioactivity:

- a. 1 Bq is equivalent to 27 pCi
- b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: [www.sgs.com.au/en-gb/environment-health-and-safety](http://www.sgs.com.au/en-gb/environment-health-and-safety).

## STATEMENT OF QA/QC PERFORMANCE

SE266094 R0

### CLIENT DETAILS

Contact **Result**  
Client **HUNTER ENVIRONMENTAL CONSULTING PTY LTD**  
Address **PO BOX 3127**  
**THORNTON NSW 2322**

Telephone **61 2 49661844**  
Facsimile **(Not specified)**  
Email **Results@hunterenviro.com.au**

Project **E0208 (Seaham)**  
Order Number **HEC0407**  
Samples **15**

### LABORATORY DETAILS

Manager **Huong Crawford**  
Laboratory **SGS Alexandria Environmental**  
Address **Unit 16, 33 Maddox St**  
**Alexandria NSW 2015**

Telephone **+61 2 8594 0400**  
Facsimile **+61 2 8594 0499**  
Email **au.environmental.sydney@sgs.com**

SGS Reference **SE266094 R0**  
Date Received **31 May 2024**  
Date Reported **07 Jun 2024**

### COMMENTS

All the laboratory data for each environmental matrix was compared to SGS' stated Data Quality Objectives (DQO). Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the Chain of Custody document.  
This QA/QC Statement must be read in conjunction with the referenced Analytical Report.  
The Statement and the Analytical Report must not be reproduced except in full.

All Data Quality Objectives were met with the exception of the following:

Analysis Date	Conductivity and TDS by Calculation - Soil	8 items
Surrogate	VOC's in Soil	1 item
	Volatile Petroleum Hydrocarbons in Soil	1 item

### SAMPLE SUMMARY

Sample counts by matrix	15 Soil	Type of documentation received	COC
Date documentation received	31/5/2024	Samples received in good order	Yes
Samples received without headspace	Yes	Sample temperature upon receipt	14.5°C
Sample container provider	SGS	Turnaround time requested	Standard
Samples received in correct containers	Yes	Sufficient sample for analysis	Yes
Sample cooling method	Ice Bricks	Samples clearly labelled	Yes
Complete documentation received	Yes		

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria. If the

## SURROGATES

SE266094 R0

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in **Green** when within suggested criteria or **Red** with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in **Green** when within suggested criteria or **Red** with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

## DUPLICATES

SE266094 R0

Duplicates are calculated as Relative Percentage Difference (RPD) using the formula:  $RPD = |OriginalResult - ReplicateResult| \times 100 / Mean$

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula:  $MAD = 100 \times SDL / Mean + LR$

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in **Green** when within suggested criteria or **Red** with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

NOTE: The RPD reported is calculated from the unrounded data for the original and replicate result. Manual calculation of the RPD from the rounded data reported may

## LABORATORY CONTROL SAMPLES

SE266094 R0

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA /QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria.

## Volatile Petroleum Hydrocarbons in Soil

Method: ME-(AU)-[ENV]AN433

Sample Number	Parameter	Units	LOR
---------------	-----------	-------	-----

## LABORATORY CONTROL SAMPLES

SE266094 R0

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA /QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria.

**Volatile Petroleum Hydrocarbons in Soil (continued)****Method: ME-(AU)-[ENV]AN433**

Sample Number	Parameter	Units	LOR	Result	Expected	Criteria %	Recovery %

TRH C6-C10 minus BTEX (F1)							

## MATRIX SPIKES

SE266094 R0

Matrix Spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub -sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in **Green** when within suggested criteria or **Red** with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

Matrix spike duplicates are calculated as Relative Percent Difference (RPD) using the formula:  $RPD = |OriginalResult - ReplicateResult| \times 100 / Mean$

The original result is the analyte concentration of the matrix spike. The Duplicate result is the analyte concentration of the matrix spike duplicate.

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula:  $MAD = 100 \times SDL / Mean + LR$

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in **Green** when within suggested criteria or **Red** with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the

No matrix spike duplicates were required for this job.

Samples analysed as received.

Solid samples expressed on a dry weight basis.

QC criteria are subject to internal review according to the SGS QA/QC plan and may be provided on request or alternatively can be found here:  
[https://www.sgs.com.au/~media/Local/Australia/Documents/Technical Documents/MP-AU-ENV-QU-022 QA QC Plan.pdf](https://www.sgs.com.au/~media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf)

- \* NATA accreditation does not cover the performance of this service.
- \*\* Indicative data, theoretical holding time exceeded.
- \*\*\* Indicates that both \* and \*\* apply.
- Sample not analysed for this analyte.
- IS Insufficient sample for analysis.
- LNR Sample listed, but not received.
- LOR Limit of reporting.
- QFH QC result is above the upper tolerance.
- QFL QC result is below the lower tolerance.
- ① At least 2 of 3 surrogates are within acceptance criteria.
- ② RPD failed acceptance criteria due to sample heterogeneity.
- ③ Results less than 5 times LOR preclude acceptance criteria for RPD.
- ④ Recovery failed acceptance criteria due to matrix interference.
- ⑤ Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).
- ⑥ LOR was raised due to sample matrix interference.
- ⑦ LOR was raised due to dilution of significantly high concentration of analyte in sample.
- ⑧ Reanalysis of sample in duplicate confirmed sample heterogeneity and inconsistency of results.
- ⑨ Recovery failed acceptance criteria due to sample heterogeneity.
- ⑩ LOR was raised due to high conductivity of the sample (required dilution).
