Job No: 57658: Client No: A0024

Executive Summary

APP Corporation (APP) engaged Prensa to conduct a Detailed Site Investigation (DSI) of the lands located to the east of St Bartholomew's Cemetery, Prospect NSW between St Bartholomew's Place and Tarlington Place (the site) to identify potential contamination at the site, provide recommendations for the design and feasibility processes and assist in Blacktown Councils Development Application. Prensa undertook a Preliminary Site Investigation (PSI) of the site in February 2018 which concluded that there was some potential for soil contamination to be associated with the following Areas of Environmental Concern (AEC):

- Soil stockpiles of unknown origin;
- Site wide potential asbestos containing materials within soil; and
- Historical use of the site.

The objective of the DSI was to investigate these AECs to identify any soil contamination that would create challenges in the design process of the cemetery expansion.

The base scope of work for the DSI comprised:

- Excavation of 47 test pits to 1.0 meters below ground level (mBGL);
- Collection of samples from near surface, 0.5 mBGL and 1.0 mBGL;
- Collection of samples from four stockpile locations; and
- Investigation of an Underground Storage Tank (UST) identified during site works.

A summary of the investigation results, for each area or areas of environmental concern, are provided below:

- Post Office and UST

Impacts associated with the former UST were unable to be fully investigated with test pits refusing on hard shale material thereby limiting the depth of the test pits advanced. With the exception of asbestos material the shallow soils did not display staining or hydrocarbon odours. Asbestos containing material (ACM) was identified within test pits TP01, TP02, TP39 and TP40 within the post office area, as well as within surface soils on the western side of the post office. ACM was also identified roadside outside the post office.

- South of Cemetery

No impact within the area directly south of cemetery was identified, based on visual assessment and laboratory data.

- Western Paddock

Limited impact associated with ACM was identified based on visual assessment and laboratory data. ACM was noted at TP14, and on the soil surface between TP30 and 31 (area denoted as 'Shed'). Further analysis did not display friable asbestos or asbestos fines.

- Improved Pasture Area

No impact associated with historical improved pasture practices were identified, based on visual assessment and laboratory data.

- Eastern Paddock

During a site walkover friable asbestos and ACM fragments were identified in the north eastern portion of this area. Friable asbestos fragments were noted on the surface which led to the temporary

covering of the area in geo fabric material. The friable asbestos is likely associated with historical structures within this area. This area required detailed consideration and mitigation strategies as several services including fibre optics, water and electrical infrastructure are located in this location. Laboratory analysis of soil samples collected from test pits in this location identified concentrations hydrocarbon (F2-Napthalene) exceeding the Ecological Screening Limit (ESL) in test pit TP9 only. . The ESL exceedance is not considered to represent a significant ecological impact area for flora and fauna given the majority of the site is to be filled and levelled.

- Stockpiles

Several stockpiles were found across the site bordering both Tarlington Place and St Bartholomew's Place. The stockpiles appear to have been generated during civil works, demolition of historical buildings and illegal dumping. Asbestos containing materials were found within the majority of stockpiles investigated with no stockpiles identified as being clear of ACM material.

Conclusion and Recommendations

The contaminants identified on site are not considered to limit the proposed development of the site with the exception of the friable asbestos area which will require further management during construction. The other contaminants identified on site are not considered to limit the ongoing site use.

The following is recommended to minimise and manage ongoing risks at the site associated with ACM:

- All workers on site should be inducted onto the Asbestos Management Plan. All site works need to take into account the potential for encountering asbestos and should manage works accordingly;
- The friable asbestos material identified in the north east of the site requires further consideration and management. It is recommended that soils from this area are relocated and capped on site in an area to be covered with hardstand, for example underneath the carpark, or that soils are removed from site. Given the presence of significant number of services in this area, both options require additional review; ;
- Deeper excavation of the area surrounding the UST was not possible at the time of the site works, therefore there is potential for contamination from the UST to exist which has not been identified during this investigation;
- It should be noted that parcels of land associated with the RMS were inaccessible for intrusive works at the time of the investigation, therefore the potential for contamination exists that has not been identified during this investigation; and
- Additional investigation is recommended around the UST and in the RMS land to assess for the presence of contamination in these areas. Additionally, it is recommended that the Asbestos Management Plan for the site is updated to include the findings of this report in regards to potential asbestos locations and controls.

Statement of Limitations

Statement of Limitations

This document has been prepared in response to specific instructions from APP Corporation to whom the report has been addressed. The work has been undertaken with the usual care and thoroughness of the consulting profession. The work is based on generally accepted standards, practices of the time the work was undertaken. No other warranty, expressed or implied, is made as to the professional advice included in this report.

The report has been prepared for the use by APP Corporation and the use of this report by other parties may lead to misinterpretation of the issues contained in this report. To avoid misuse of this report, Prensa advise that the report should only be relied upon by APP Corporation and those parties expressly referred to in the introduction of the report. The report should not be separated or reproduced in part and Prensa should be retained to assist other professionals who may be affected by the issues addressed in this report to ensure the report is not misused in any way.

Prensa is not a professional quantity surveyor (QS) organisation. Any areas, volumes, tonnages or any other quantities noted in this report are indicative estimates only. The services of a professional QS organisation should be engaged if quantities are to be relied upon.

Sampling Risks

Prensa acknowledges that any scientifically designed sampling program cannot guarantee all sub-surface contamination will be detected. Sampling programs are designed based on known or suspected site conditions and the extent and nature of the sampling and analytical programs will be designed to achieve a level of confidence in the detection of known or suspected subsurface contamination. The sampling and analytical programs adopted will be those that maximises the probability of identifying contaminants. APP Corporation must therefore accept a level of risk associated with the possible failure to detect certain sub-surface contamination where the sampling and analytical program misses such contamination. Prensa will detail the nature and extent of the sampling and analytical program used in the investigation in the investigation report provided.

Environmental site assessments identify actual subsurface conditions only at those points where samples are taken and when they are taken. Soil contamination can be expected to be non-homogeneous across the stratified soils where present on site, and the concentrations of contaminants may vary significantly within areas where contamination has occurred. In addition, the migration of contaminants through groundwater and soils may follow preferential pathways, such as areas of higher permeability, which may not be intersected by sampling events. Subsurface conditions including contaminant concentrations can also change over time. For this reason, the results should be regarded as representative only.

APP Corporation recognises that sampling of subsurface conditions may result in some cross contamination. All care will be taken and the industry standards used to minimise the risk of such cross contamination occurring, however, Property NSW recognises this risk and waives any claims against Prensa and agrees to defend, indemnify and hold Prensa harmless from any claims or liability for injury or loss which may arise as a result of alleged cross contamination caused by sampling.

Reliance on Information Provided by Others

Prensa notes that where information has been provided by other parties in order for the works to be undertaken, Prensa cannot guarantee the accuracy or completeness of this information. APP Corporation therefore waives any claim against the company and agrees to indemnify Prensa for any loss, claim or liability arising from inaccuracies or omissions in information provided to Prensa by third parties. No indications were found during our investigations that information contained in this report, as provided to Prensa, is false.

Recommendations for Further Study

The industry recognised methods used in undertaking the works may dictate a staged approach to specific investigations. The findings therefore of this report may represent preliminary findings in accordance with these industry recognised methodologies. In accordance with these methodologies, recommendations contained in this report may include a need for further investigation or analytical analysis. The decision to accept these recommendations and incur additional costs in doing so will be at the sole discretion of APP Corporation and Prensa recognises that APP Corporation will consider their specific needs and the business risks involved. Prensa does not accept any liability for losses incurred as a result of APP Corporation not accepting the recommendations made within this report.

Table of Contents

1 Introduction

APP Corporation (APP) engaged Prensa Pty Ltd (Prensa) to undertake a Detailed Site Investigation (DSI) of the land located east of St Bartholomew's Cemetery, Prospect NSW (the site). The site consists of 22 adjacent lots, with a combined total area of approximately 8 hectares. The approximate boundaries of the site are shown on **Figure 1** in the 'Figures' section of this report.

The current zoning of the site is SP2 – infrastructure, RE1 – public recreation and RU4 – Primary Production Small lots according to the Blacktown City Council Local Environment Plan (2015). Prensa understands that Blacktown Council are proposing to rezone the site to SP1 Cemetery to develop the site into a cemetery, expanding on the existing St Bartholomew's Cemetery.

APP has requested Prensa to conduct this DSI to identify potential contamination at the site which may pose a risk to human health and/or the environment which may preclude the development of the site, and assist in Blacktown Councils Development Application.

2 Background

It is understood that Blacktown Council wish to rezone the site to SP1 Cemetery and develop the site into a cemetery. As part of the process a PSI report was required to be compiled and appended in the Planning Proposal, and a DSI report to be undertaken and appended in the Development Application.

Prensa was engaged in December 2017 to complete a Preliminary Site Investigation (PSI) at the site to provide an indication of the potential for contamination to exist at the site as a result of current and/or historical activities. The PSI identified the following areas of environmental concern (AECs):

- Soil stockpiles of unknown origin;
- Site wide potential asbestos containing materials (ACM) within soil;
- Area of suspected improved pasture and agricultural practices; and
- Additionally, an UST was suspected after gaining access to previously inaccessible areas during the DSI works.

The above AECs have been identified on **Figure 2**, in the 'Figures' section of this report.

Based on the findings of the PSI, APP commissioned Prensa to undertake this DSI to provide an indication of the potential presence of soil contamination in the identified AECs. Fieldwork was undertaken at the site between 13th and 16th March 2018, and the findings of the DSI are summarised within this report.

3 Objective

The objective of the DSI was to assess the presence of contamination at the site, as a result of current and/or historical activities that may pose a risk to human health and/or the environment associated with the proposed development of the site.

4 Scope of Works

Prensa undertook the following scope of works:

- Fieldwork preliminaries comprising:
  - Preparation of a Site-Specific Safety Plan (SSP); and
  - Dial before you dig (DBYD) search.
- Fieldwork comprising:
  - Service location of underground services with a qualified service locator;
  - Collection of soil samples from four stockpiled areas (presented on **Figure 3** in the 'Figures' section of this report);
  - Excavation of 47 test pits in a gridded pattern across the site using a three tonne excavator to a depth of 1.0 m below ground level (mBGL);
  - The locations of the 47 test pits have been presented on **Figure 4** in the 'Figures' section of this report. The rationale for the test pit locations was as follows:
    - TP38-40 targeted the UST and surrounding area;
    - TP5 and TP6 targeted the area where friable asbestos had been previously identified;
    - TP16-17 and TP43-46 targeted areas where improved pasture was previously suspected; and
    - All other test pit locations were arranged in a gridded pattern across the site.
  - Collection of soil samples from each test pit;
  - Surface inspection for the presence of potential asbestos-containing material (ACM) and collection of potential ACM fragments for confirmation of asbestos presence;
  - Field screening for asbestos containing materials in 7 test pits as per National Environmental Protection Amended Measure (NEPM 2013) comprising:
    - Collection of and field screening of 10L soil samples using a 7 mm sieve; and
    - Collection of bulk samples if suspected bonded ACM fragments >7 mm were observed.
    - Locations for the field screening was as follows:
      - TP5 and TP6 targeted the friable asbestos area;
      - TP14 targeted where ACM was identified;
      - TP29 and TP31 targeted areas in the proximity of stockpiles/locations where ACM had been previously identified; and
      - TP39 and TP40 targeted areas where ACM was identified on the surface.
  - Field screening of soil samples using a photo-ionisation detector (PID); and
  - Backfilling of the test pits, restoring the ground surface to original condition as best possible.
- Laboratory analysis of primary soil samples and quality control (QC) samples at National Association of Testing Authorities (NATA) accredited laboratories for contaminants of potential concern (CoPC); and
- Preparation of this DSI report.

It should be noted that 50 test pits were initially proposed, however at the time of Prensa's site work, land associated with RMS (Lot 3 in DP 1134381 and Lots 12 and 13 in DP 802753) was not accessible, therefore there is some potential for contamination to exist in this area that has not been identified as part of this investigation and should be further investigated post land transfer. It should also be noted that the sampling density is below that required in Australian Standard 4482.1 for a site of this size, however due to the limited areas of environmental concern identified (area primarily open

space/paddocks) 47 sampling locations are considered sufficient to address the objectives of the assessment.

5 Technical Framework

Works on the site were undertaken in general accordance with the following:

- NSW Work Health and Safety Act 2011 (WHS Act 2011);
- NSW Work Health and Safety Regulation 2011 (WHS Regulation 2017);
- NSW Code of Practice: How to Manage and Control Asbestos in the Workplace, 2016;
- NSW Code of Practice*: How to Safely Remove Asbestos,* 2016;
- The Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act 1999);
- Contaminated Land Management (CLM) Act, 1997 (CLM Act 1997);
- Contaminated Land Management Amendment Act 2008;
- Protection of the Environment Operations (POEO) Act 1997 (POEO Act 1997);
- NSW Environmental Protection Agency (EPA) POEO UPSS Regulation 2014 (UPSS Regulation 2014);
- National Environment Protection Council (NEPC) Act 1994 (NEPC Act 1994);
- National Environment Protection Council, National Environment Protection (Assessment of Site Contamination) Measure, 1999 (April 2013) (NEPM 2013);
- Department of Environment, Climate Change and Water NSW (DECCW), Guidelines for implementing the UPSS Regulation (2008), (DECCW 2009);
- CRC Care Technical Report No. 10, Health Screening Levels for Petroleum Hydrocarbons in Soil and Groundwater, 2011 (CRCCARE 2011);
- NSW Office of Environment and Heritage (OEH), Guidelines for Consultants Reporting on Contaminated Sites, 2011 (OEH 2011);
- Australian Standard (AS) 4482.1, Guide to Investigation and Sampling of Sites with Potentially Contaminated Soil, Part 1: Non-volatile and Semi-volatile Compounds, 2005;
- AS 4482.2, Guide to the Sampling and Investigation of Potentially Contaminated Soil, Part 2: Volatile Substances, 1999; and
- AS 1726 Geotechnical Site Investigations, 1993.

6 Data Quality Objectives

Systematic planning and verification was deemed critical for the successful implementation of the DSI to ensure that the data collected is reliable and representative. A process for establishing data quality objectives (DQOs) for an investigation has been defined by the United States Environmental Protection Agency (US EPA). That process has been adopted in AS 4482.1-2005 and referenced in NEPM 2013.

DQOs ensure that:

- The study objectives are set;
- Appropriate types of data are collected (based on proposed land use and CoPC)); and
- The tolerance levels are set for potential decision making errors.

The DQO process is a seven-step iterative planning approach used to plan for environmental data collection activities. It provides a systematic approach for defining the criteria that a data collection design should satisfy, including when, where and how to collect samples or measurements,

determination of tolerable decision error rates and the number of samples or measurements that should be collected.

The seven-step process for this investigation and data quality indicators adopted are discussed and summarised in Appendix A.

7 Site Information

7.1 Site Location

Table 1: Site Identification Details

Site Area	Approximately 8 hectares		
Owner	Blacktown City Council, Department of Planning, Roads and Maritime Services, Trustees of former Prospect School of Arts		
Local Government Area	Blacktown City Council		
Current use	Vacant Land		
Current Zoning	RE1 – Public Recreation under Blacktown Local Environmental Plan 2015; RU4 – Primary Production Small Lots under Blacktown Local Environmental Plan 2015; and SP2 – Infrastructure (Road Classified) under Blacktown Local Environmental Plan 2015		
Title identification	Lot 15 in DP 801210	Lot 25 in DP 448744	Lot 2 in DP 456722
	Lot 1 in DP 134024	Lot 26 in DP 448744	Lot 21 in DP 1150386
	Lot 2 in DP 134024	Lot 27 in DP 448744	Lot 22 in DP 1150386
	Lot 3 in DP 134024	Lot 20 in DP 744595	Lot 3 DP 1134381
	Lot 21 in DP 448744	Lot 11 in DP 802753	Lot 13 in DP 802753
	Lot 22 in DP 448744	Lot 1 in DP 744431	Lot 12 in DP 802753
	Lot 23 in DP 448744	Lot 1 in DP 456722	Lot 140 in DP 1003460
	Lot 24 in DP 448744		

Site identification details are summarised in **Table 1** below and the location of the site is shown on **Figure 1**, provided in the 'Figures' section of this report.

7.2 Surrounding Land use

At the time of the site inspection, the area in the immediate vicinity of the site was a combination of vacant land and low density residential and commercial properties. The site was bound to the:

- **North** by Great Western Highway, beyond which were large retail properties and low density residential properties;
- **East** by vacant land, beyond which was Prospect Hotel and Clunies Ross Street;
- **West** by St Bartholomew's Place, St Bartholomew's Church and cemetery beyond which was vacant land. Further west was low density residential and retail properties; and
- **South** by Western Motorway M4, beyond which was industrial properties, including Austral Masonry and a Boral Asphalt facility. Approximately 2.0 km south west of the site is Prospect Reservoir and Nature Reserve.

7.3 Site Description

The site and surrounding land use at the time of the DSI were considered to be relatively unchanged since the PSI was undertaken.

The site description is based on visual observations made by a Prensa Consultant during the DSI fieldwork in March 2018. The layout of the site, including the AECs, is shown on **Figure 2** in the 'Figures' Section of this report. Photographs taken during the DSI are provided in **Appendix B**.

The main access to the property was via driveway off Ponds Road on the northern boundary, as well as Tarlington Place off Great Western Highway. The majority of the site is vacant land, with the south eastern portion of the site occupied by the Former Prospect Post Office. The site had a slight slope towards the centre of the site from west to east/east to west towards what appeared to be a small pond or creek in the middle of the suspected irrigated pasture zone. Overall the site area sloped from south west to north east which was generally consistent with the topography of the surrounding area. With the exception of the post office and asphalt roads (Tarlington Place and St Bartholomew's Place) the site was covered in patchy grass, weeds, shrubs and trees, with denser trees and woodland in the south east portion of the site, unchanged since the PSI walkover. Approximately 15 stockpiles of varying size were identified across the site and appeared to comprise of batters constructed on the side of St Bartholomew's Place and Tarlington Place, and dumped soil with anthropogenic waste material. Additional stockpiles were noted to the east of Tarlington Place which were concluded to be outside of our investigation boundary and out of the scope of this investigation. During the site works, contractors were undertaking slashing works on the dense grass and shrubs/bushes which covered the majority of the site (Photo 1 - 5).

Evidence of a UST was identified by a vent pipe on the western side of the post office. After clearing grass and vegetation around the suspected UST area, what appeared to be fill points were identified around the base of the vent pipe, providing additional evidence of the UST in this location. However it should be noted that no dip point was located after further clearing of the area, leaving the size and condition of the UST unknown. It should also be noted that soils disturbed in this area were noted to contain significant amounts of asbestos fragments. The asbestos containing fibre cement sheeting (FCS) was also noted road side of Tarlington Place outside the post office, on the western side of the post office between the external and internal fences and on the western perimeter of the site, east of St Bartholomew's Place.

A septic tank was also noted within the post office boundary on the eastern side of the post office. A brick pit was identified to the rear of the post office, the use of which is unknown. It appeared the pit was in the footprint of a building that previously existed in this area (Photos 6 - 8).

After vegetation was cleared on site, further suspected friable asbestos containing material was noted on the soil surface near the friable asbestos zone in the north eastern corner of the site. The suspected friable asbestos material was observed in poor condition and believed to be of the same source as the material observed during the PSI inspection. A suspected asbestos containing conduit (0.5m) and FCS fragments were also identified in this area. FCS fragments were also found in surface samples at test pits TP1, TP2, TP14, TP39 and TP40 (Photo 9 & 10).

The fibre cement fragments observed onsite were in fair to poor condition with fragments collected for analysis from all locations mentioned above (sample locations are shown in **Figure 5** in the 'Figures' section of this report).

Discoloured black soils were noted at TP7 and appeared to contain burnt ash material, charcoal and burnt slag materials. This black soil was inferred to be associated with incinerator/ash waste. Surface

scrapes around this area were carried out to further delineate the extent of the burnt waste, which extended in an approximately 4 meter diameter to the south of TP7, after which the soils appeared unstained and "natural" in appearance (Photo 11 & 12).

Construction/demolition waste was apparent in some locations where dumping was identified. After vegetation had been cleared, construction waste, garbage and car tyres were also identified in the north eastern corner of the site and the western perimeter of the site, north of SP4 (identified as a previous Shed area).

No hazardous chemical storage was identified at the time of the investigation. The layout of the site is shown on Figure 1 in the 'Figures' section of this report, and site divisions are shown in Figure 6. Photographs taken during the investigation are provided in Appendix B.

8 Site History Summary

8.1 Previous Investigations

During the DSI, Prensa reviewed a Preliminary Site Investigation (PSI) (*Preliminary Site Investigation, St Bartholomew's Cemetery Expansion Lands, Prospect NSW, February 2018)* which had also been prepared by Prensa. The PSI identified:

- Asbestos containing material in the following locations:
  - North eastern corner of the site;
  - Western boundary of the site (St Bartholomew's Place);
  - Roadside adjacent the eastern concrete Jersey barrier; and
  - Soil surface at the end of Tarlington Place in the south eastern corner of the site
- Overgrown soil stockpiles in the following locations:
  - North eastern portion of the site;
  - Western perimeter roadside of St Bartholomew's Place; and
  - East of Tarlington Place (considered out of scope for this investigation).
- Potential area of improved pasture in the central portion of the site.

8.2 Historical Documentation

8.2.1 Title Search

A title search undertaken by Morris Hayes & Edgar Pty Ltd (MHE) during the PSI provided a list of proprietors for ten lots, selected based on evidence of prior occupation such as buildings or structures identified in the aerial photographs and site inspection. A full list of proprietors for the selected lots and associated plans are provided in **Appendix H**.

8.2.2 SafeWork NSW Dangerous Goods Search

The SafeWork NSW Dangerous Goods search was unable to be undertaken during the PSI as the proposed lots ownership had not been transferred to Blacktown City Council at the time.

9 Environmental Setting

Environmental setting information has been outlined in **Table 2** below, some of which has been summarised from the PSI. This is considered to be relevant at the time this DSI was undertaken.

Table 2: Summary of Environmental Setting

Item	Description

Regional Geology	A review of the 1:100,000 Geological Series Map of Penrith (Department of Mineral Resources Geological Survey of NSW, Map Sheet: 9030, First Edition, 1991) indicated the site is underlain by the Wianamatta Group Shales and Hawkesbury Shale, comprising of fine to medium grained quartz-lithic sandstone.
Surface Water	The site has a slight slope to the east with surface water and stormwater from the site likely to discharge into Girraween Creek, a tributary of Toongabbie Creek located approximately 340 m south east of the site at the closest point.
Groundwater	Based on the local topography, it is anticipated that regional groundwater beneath the site flows in a north easterly direction towards Toongabbie Creek, a tributary of Parramatta River. A review of the New South Wales Department of Primary Industries (DPI) Office of Water Groundwater Works database online (http://allwaterdata.water.nsw.gov.au/water.stm) accessed 16th January 2018, indicated that there were 4 registered groundwater bores within a 500 m radius of the site. Groundwater wells were identified as monitoring bores and are all associated with the historical use of the site by the company Caltex Oil and are assumed to be associated with a possible petrol station at this location.
Acid Sulfate Soils	A review of Acid Sulfate Soil information contained within the online Australian Soil Resource Information System (ASRIS) database (http://www.asris.csiro.au/index_ie.html), accessed on 16th January 2018, indicated there was no known occurrence of acid sulfate soils occurring beneath the site.

10 Areas of Environmental Concern

10.1 Potential Sources of Contamination

The PSI identified the following AECs:

- Soil stockpiles of unknown origin;
- Site wide potential asbestos containing materials within soil;
- Historical use of the site; and
- Additionally, an UST was suspected during the DSI works.

The above AECs have been identified on **Figure 2**, in the 'Figures' section of this report.

10.2 Contaminants of Potential Concern

The following CoPC were identified following a review of the information presented in the PSI:

- Total recoverable hydrocarbons (TRH);
- Benzene, toluene, ethylbenzene and xylenes (BTEX);
- Polycyclic aromatic hydrocarbons (PAHs);
- Organochlorine pesticides and organophosphate pesticides (OCP/OPP);
- Polychlorinated biphenyls (PCBs);
- Volatile organic compounds (VOCs);
- Metals (arsenic, cadmium, chromium, lead, nickel, zinc, mercury and copper); and
- Asbestos.

Potential sources and the associated CoPC are summarised in **Table 3** below**.**

Table 3: Targeted Areas and Potential Contaminants of Concern

Potential Source	Location	Contaminants of Potential Concern
Importation of fill during construction/development of the site. Poor	Site wide	TRH, BTEX, PAH, OCP/OPP, PCB, metals and asbestos

demolition practices introducing construction waste or impacted soil into surface soils.		
Importation or illegal dumping of materials on site, introducing construction waste or impacted soil to site.	SP1, SP2, SP3, SP4 and Shed	TRH, BTEX, PAH, OCP/OPP, PCB, metals and asbestos
Pesticide use in this area	TP16, TP17, TP 43, TP44, TP45, TP46	OCP/OPP
Underground Storage Tank and surrounding area	TP38, TP39 and TP40	TRH, BTEX, PAH,OCP/OPP, VOC and PCB

10.3 Potential Receptors and Exposure Pathways

Based on a commercial/industrial site use and the potential sources of contamination outlined above, the potential receptors from contamination were considered to comprise:

- Future construction workers from:
  - Dermal contact with contaminated soil/dust;
  - Ingestion of contaminated soil/dust; and
  - Vapour inhalation of volatile contaminants.
- Groundwater (leachable contaminants and potential leaks from USTs and ASTs).
- Terrestrial ecosystems from direct uptake and diffusion of CoPC in soil.

Migration of CoPC in the subsurface may be influenced by zones of higher permeability within the fill and/or natural strata and/or underground services present beneath the site.

11 Assessment Criteria

The criteria adopted for this investigation are outlined in **Table A**, in the 'Tables' section of this report, and have been discussed in detail in **Appendix C**.

To assess the significance of contaminant concentrations in soil, reference was primarily made to NEPM (2013), 'Schedule B1 Guideline on Investigation Levels for Soil and Groundwater' (Schedule B1), assessment criteria, where available. Schedule B1 provides a framework for the use of investigation and screening levels based on human health and ecological risks. In the absence of relevant criteria in NEPM (2013), reference was made to other nationally or state endorsed guidelines.

Based on the objectives and the development of the site under its current zoning of RE1 – Public Recreation (predominant), RU4 – Primary Production Small Lots and SP2 – Infrastructure, criteria for an urban residential/public open space land use was deemed appropriate for this DSI.

Soil Health Investigation Levels (HILs), soil Health Screening Levels (HSLs), Ecological Investigation Levels (EIL s), Ecological Screening Levels (ESLs), and petroleum hydrocarbon Management Limits were adopted from Schedule B1 of NEPM (2013) while Direct Contact criteria were adopted from CRC CARE (2011).

EIL/ESL criteria have been adopted as Tier 1 assessment criteria with the majority of site consisting of grasses and trees. In addition to the grass areas on site, the Toongabbie Creek to the north east of site presents a local ecological receptor. These have only been adopted as a screening tool as it is understood that the site will be developed with significant amounts of material to be imported onto site changing the existing height by several metres in some locations, thereby potentially making the EIL/ESL criteria invalid.

The specific adopted criteria are outlined in **Table A**, in the 'Tables' section of this report, and discussed in **Appendix C**.

12 Fieldwork Methodology

12.1 Fieldwork Preliminaries

A desktop search for underground services was undertaken using the DBYD service.

A SSP was prepared to document the foreseeable hazards associated with the works and to outline the measures that would be implemented to remove or manage the associated health and environmental risks.

Prior to ground disturbance, test pit locations were cleared of underground and overhead services by Mr Mac Group (Mr Mac), a licensed underground services locator.

12.2 Test Pit Rationale

The intrusive works were undertaken over three days, 14 – 16 March 2018. Test pit progression methodology and rationale for the soil assessment are described in **Table 4** below. Locations below are presented in **Figure 4** in the 'Figures' section of this report.

Table 4: Test Pit Methods and Rationale

Test Pit ID	Location	Surface	Target Depth (mBGL)	Sampling Method	Rationale
TP1	Post office area	Grass/bare soil	1.0	Excavator	Site coverage
TP2	Post office Area	Grass/bare soil	1.0	Excavator	Test pit installed near septic tank
TP3	Post office area	Grass/bare soil	1.0	Excavator	Site coverage
TP4	Eastern paddock	Grass/bare soil	1.0	Excavator	Site coverage
TP5	Eastern paddock	Grass/bare soil	1.0	Excavator	Test pit installed in close proximity to friable asbestos area
TP6	Eastern paddock	Grass/bare soil	1.0	Excavator	Test pit installed in close proximity to friable asbestos area
TP7	Eastern paddock	Grass/bare soil	1.0	Excavator	Site coverage
TP8	Eastern paddock	Grass/bare soil	1.0	Excavator	Site coverage

12.3 Stockpile sampling Rationale

The stockpile sampling was undertaken on the 13th March 2018. Stockpile locations are presented in **Figure 3** in the 'Figures' section of this report.

Table 5: Stockpile Sampling Methods and Rationale

Stockpile ID	Location	Surface	Target Depth (mBGL)	Sampling Method	Rationale
SP1-01	South eastern corner of site	Grass/trees	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP1-02	South eastern corner of site	Grass/trees	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP1-03	South eastern corner of site	Grass/trees	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP2-01	North eastern corner of site	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP2-02	North eastern corner of site	Grass/bare soil	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP2-03	North eastern corner of site	Grass/bare soil/shrubbery	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP2-04	North eastern corner of site	Grass/bare soil/shrubbery	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP3-01	South western corner of site	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP3-02	South western corner of site	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation

SP3-03	South western corner of site	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP04-01	Western boundary of site (roadside St Bartholomew's Place)	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP04-02	Western boundary of site (roadside St Bartholomew's Place)	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP04-03	Western boundary of site (roadside St Bartholomew's Place)	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SP04-04	Western boundary of site (roadside St Bartholomew's Place)	Grass	0.1-0.2 (Surface)	Trowel/shovel	Stockpile characterisation
SHED	Western boundary of site (north east of SP04-03)	Grass/bare soil	0.1/0.2 (Surface)	Trowel/shovel	Stockpile characterisation

13 Laboratory Analysis

Eurofins Mgt Pty Ltd (Eurofins) and Australian Laboratory Services Pty Ltd (ALS) were engaged as the primary and secondary or 'check' laboratory for chemical testing, respectively. The laboratories are NATA accredited for the analysis undertaken.

Primary soil samples were submitted for analysis of CoPC as outlined below in **Table 5**.

Table 5: Analytical Schedule

AEC	Sample Locations	Sample ID	Analysis
Underground Storage Tank	TP38, TP39 and TP40	TP38_0.0-0.1, TP39_0.0-0.1, TP40_0.0-0.1	Metals, TRH, BTEX, PAH, OCP/OPP, PCB, VOC and asbestos

14 Results

14.1 Subsurface Profile

The majority of the site comprised of natural brown silty clays and brown-red clays. Fill material was not noted consistently across the site or to significant depths but was identified in surface soils 0.0-0.2 mBGL in only a number of test pits. A summary of fill material types encountered on site are included below:

- Fill at TP1 and TP2 consisted of a brown silty clay with tile, blue metal, glass and asbestos;
- TP4 consisted of a dark orange clay with loose concrete and glass;
- Fill within TP5 and TP6 consisted of dark brown silty clay and sandy clay, with glass, tile fragments, plastic and stones;
- TP7 consisted of black, sandy clay with metal and glass, and was suspected to be incinerator waste;
- Fill within TP14 consisted of tan brown silty clay with glass and asbestos fragments throughout;
- TP30 consisted of brown sandy clay, with concrete blocks and pieces of ceramic;
- Fill within TP38 consisted of brown sandy clay with building debris including bricks, tiles, crushed concrete and blue metal (40%);
- Fill within TP39 consisted of dark brown silty clay and an asbestos fragments;
- TP40 consisted of brown sandy clay with glass, concrete, metal, asbestos fragments and blue metal; and
- TP41 consisted of brown sandy clay with ceramic fragments, crushed concrete and river stones (10%).

Natural soil was generally identified at depths between 0.1-0.3 mBGL within test pit locations across the site. The natural material identified was described as soft to hard, brown-red to grey clay.

Subsurface conditions were logged in general accordance with AS 1726 – 1993.

Copies of the soil logs are provided in **Appendix D**.

14.2 Field Screening

A PID was used to screen the soil profile at each test pit location. The results are shown on the soil logs in **Appendix D**. The majority of PID readings across the site were low (i.e. <10 ppm), with the exception of one reading at TP44 (33.8 ppm).

14.3 Analytical Results

Laboratory results are provided in **Appendix E** and are summarised in **Table A** in the 'Tables' section of this report. Test pit and stockpile locations are shown in **Figure 3 & 4** in the 'Figures' Section of this report.

Analytical results for the soil samples analysed as part of this DSI did not exceed adopted health-based criteria for commercial/industrial land use at the site.

Specific summaries for each of the area of the site/AEC is as follows:

Post Office Area and UST

Laboratory results from soil sampled from the test pit targeting fill material near the UST (TP38) and surrounding the post office (TP1, TP2, TP3, TP39, TP40 and TP41) can be summarised as follows:

- Concentrations of TRH, BTEX and PAHs were below the laboratory practical quantitation limit (PQL) in the nine samples taken from TP1, TP3, TP38, TP40 and TP41;
- Concentrations of OCPs, OPPs and PCBs were below the PQL in all eight samples analysed;
- Concentrations of TRH at TP2_0.0-0.1 were above the PQL but below the adopted site assessment criteria with no detections of TRH within deeper sample (TP2 0.6-0.7) ;
- Concentrations of PAH within sample TP39_0.0-0.1 were above the PQL but below the adopted site assessment criteria with no detections of PAHs within the deeper sample (TP39_0.4-0.5);
- Concentrations of VOCs for TP38, TP39 and TP40 were below the PQL; and
- Metal concentrations were generally above the PQL but were below the adopted site assessment criteria, with the exception of zinc in soil samples TP2_0.0-0.1 (780 mg/kg), TP39_0.0-0.1 (570 mg/kg), TP40_0.0-0.1 (530 mg/kg) and TP41_0.0-0.1 (480 mg/kg) which exceeded the site specific EILs (360 mg/kg) for a commercial/industrial land use.

South of Cemetery

Laboratory results from soil sampled from test pits to the south of the cemetery (TP33-TP37) can be summarised as follows:

- Concentrations of TRH, BTEX and PAHs were below the PQL in all nine samples analysed;
- Concentrations of OCPs, OPPs and PCBs were below the PQL in all five samples analysed; and
- Concentrations of metals were generally above the PQL but were below the adopted site assessment criteria in all nine samples analysed.

Western Paddock

Laboratory results from soil sampled from the test pits in the western portion of the site (TP13, TP14, and TP18-TP32) can be summarised as follows:

- Concentrations of TRH, BTEX and PAHs were below the PQL in all 35 samples analysed;
- Concentrations of OCPs were above the PQL but were below the adopted site assessment criteria in 14 of the 17 samples analysed, and below the PQL for three samples;
- Concentrations of OPP and PCBs were below the PQL in all 17 samples analysed; and
- Concentrations of metals were generally above the PQL but were below the adopted site assessment criteria in all 35 samples analysed.

Improved Pasture Area

Laboratory results from soil sampled from test pits targeting the area of suspected improved pasture (TP16, TP17, TP43-TP46) and central area (TP15, TP42, TP47) can be summarised as follows:

- Concentrations of TRH, BTEX and PAHs were below the PQL in all 18 samples analysed;
- Concentrations of OCPs were above the PQL but were below the adopted site assessment criteria in all four of the nine samples analysed, and below the PQL in five samples;
- Concentrations of OPP and PCBs were below the PQL in all nine samples analysed; and

- Concentrations of metals were generally above the PQL but were below the adopted site assessment criteria in all 18 samples analysed.

Eastern Paddock

Laboratory results from soil sampled from the test pits in the eastern portion of the site (TP4-TP12) can be summarised as follows:

- Concentrations of BTEX and PAHs were below the PQL in all 18 samples analysed;
- Concentrations of TRHs were below the PQL with the exception of F2-Naphthalene which was reported above the ESL criteria in sample TP9_0.0-0.1 (64 mg/kg) ;
- Concentrations of OCPs were above the PQL but were below the adopted site assessment criteria in two of the samples analysed, and below the PQL in seven of the samples;
- Concentrations of OPP and PCBs were below the PQL in all nine samples analysed; and
- Concentrations of metals were generally above the PQL but were below the adopted site assessment criteria in the 18 samples analysed.

Stockpiles

Laboratory results from the 15 samples targeting the four stockpiles located on site (identified on **Figure 3** in the 'figures' section of this report) can be summarised as follows:

- Concentrations of BTEX, OPP and PCBs were below the PQL in all 15 samples analysed;
- Concentrations of TRHs were detected above the PQL in 6 of 15 samples, but below the adopted site assessment criteria;
- Concentrations of PAHs were detected above the PQL but were below the adopted site assessment criteria in all 15 samples analysed;
- Concentrations of OCPs were above the PQL in three samples but were below the adopted site assessment criteria; and
- Concentrations of metals were generally above the PQL but were below the adopted site assessment criteria with the exception of zinc in sample SP04_01 (370 mg/kg) which exceeded the site specific EILs (360 mg/kg) for a commercial/industrial land use.

Asbestos sampling

Asbestos presence/absence testing was undertaken on the soil samples from all forty-seven test pits. Laboratory analysis indicated no asbestos fibres were detected at the reporting limit of 0.1 g/kg. Field screening for asbestos as per NEPM (2013) was undertaken at seven locations across the site (TP5, TP6, TP14, TP39, TP31, TP39 and TP40). Laboratory analysis of the samples did not identify any asbestos at the reporting limit of 0.1 g/kg.

ACM fragments were also collected and submitted for analysis. Fibre cement sheet fragments were positive for asbestos at test pit location TP1, TP2, TP14, TP39, and TP40, and on all four stockpiles. Other ACM fragments were identified on the surface around the site and are shown in **Figure 5** in the figure section of this report. A summary of the positive asbestos results are outlined below in **Table 6.**

Table 6: Asbestos Analytical Summary

Sample location	Depth	Result
TP01 – post office area	0.1-0.2	Chrysotile (White asbestos)
TP02 – post office area	0.0-0.1	Chrysotile (White asbestos)
TP14 – western paddock	0.0-0.1	Chrysotile (White asbestos) Amosite (Brown asbestos)
TP39 – UST area	0.0-0.1	Chrysotile (White asbestos) Amosite (Brown asbestos) Crocidolite (Blue asbestos)
TP40 – UST area	0.0-0.1	Chrysotile (White asbestos) Amosite (Brown asbestos)
SP01-01 – south eastern corner, end of Tarlington Place	0.1-0.2	Chrysotile (White asbestos)
SP02-02 – north eastern corner	0.0-0.1	Chrysotile (White asbestos) Crocidolite (Blue asbestos)
SP02-04 – north eastern corner	0.0-0.1	Chrysotile (White asbestos) Amosite (Brown asbestos)
SP03-03 – western perimeter, east of St Bartholomew's Place	Surface	Chrysotile (White asbestos) Amosite (Brown asbestos) Crocidolite (Blue asbestos)
SP04-01 – western perimeter, east of St Bartholomew's Place	0.1-0.2	Chrysotile (White asbestos) Amosite (Brown asbestos)
Roadside outside post office	Surface	Chrysotile (White asbestos) Amosite (Brown asbestos) Crocidolite (Blue asbestos)
Western perimeter, 'shed'	Surface	Chrysotile (White asbestos)
North eastern corner, adjacent asbestos zone	0.1-0.2	Chrysotile (White asbestos) Amosite (Brown asbestos)
Post office area, western side between external and internal fence	0.0-0.2	Chrysotile (White asbestos) Amosite (Brown asbestos) Crocidolite (Blue asbestos)

15 Discussion

Discussion of field and analytical results have been split into defined areas of the site. The areas were identified based on available information and site observations during the PSI undertaken by Prensa consultants.

15.1 Post Office Area and UST

A vent pipe assumed to be associated with an UST was identified and further investigated. No dip point was able to be located and without the use of a Ground Penetrating Radar (GPR) the presence of the UST was unable to be confirmed. Test pitting activities were undertaken in this area however Prensa was unable to undertake a deeper excavation with the excavator on site refusing on bedrock. The potential for contamination arising from the suspected UST at depth is still unknown. No visual contamination or hydrocarbon odour associated with historical use of the UST was noted however as discussed the test pits were unable to be advanced to depth. It should be noted that the test pits advanced in this identified fill material with ACM fragments present in TP1, TP2, TP39 and TP40.

Laboratory chemical analytical results for samples collected from these test pits were either below the PQL or below the adopted site assessment criteria for commercial/industrial land use with the exception of zinc levels which exceeded the EIL criteria in the four test pits surrounding the Post Office building. It is likely that zinc levels noted in this location are derived from the galvanised sheet metal roofing of the post office building, which can undergo a leaching process from contact with rainwater, resulting in zinc being deposited in the surrounding soils. The elevated zinc in this location, above the ESL criteria, is not considered to limit the ongoing use of the site as a cemetery. Additionally due to the proposed importation of fill material to the site, it is considered that the asbestos identified on site will be covered in the future. In the short term however any works in this area need to consider and be undertaken as per the Asbestos Management Plan for the site.

15.2 South of Cemetery

Test Pits TP33-TP37 were advanced to assess the potential contamination surrounding the two high voltage power line pylons and the land in between the cemetery and the Motorway. The area was uneven with what appeared to be an old road running alongside the cemetery's fence line. Charcoal and bitumen fragments were noted within soil in this area however all results from the soil samples analysed from the test pits were either below the PQL or the adopted site assessment criteria for a commercial/industrial land use. Visual assessments of the test pits and laboratory analysis did not display any other contaminants within the area directly south of the cemetery.

15.3 Western Paddock

Test Pits in the Western Paddock portion of the site were progressed in a gridded pattern to assess this expansive section of the property. No AECs were identified which warranted specific sampling locations in this area of the site. The results from the soil samples analysed from the seventeen test pits were either below the PQL or the adopted site assessment criteria for commercial/industrial land use. ACM fragments were found within TP14. No asbestos fines or friable material was identified above the detection limit in any of the soil samples taken from this area. Old concrete footings and a wire fence was noted in close proximity to this area which would suggest the presence of historical buildings in this area, which are likely the origin of the asbestos fragments identified at TP14. Visual assessments of the test pits and laboratory analysis did not display any other contaminants within the western paddock area.

15.4 Improved Pasture Area

Test pits TP15-TP17 and TP42-TP47 were advanced to assess the potential contamination within and surrounding the area where improved pasture was previously suspected. All results from the soil samples taken from the nine test pits were either below the PQL or below the adopted site assessment criteria for commercial/industrial land use. Based on visual assessment and laboratory data, no impact associated with agricultural practices was identified.

15.5 Eastern Paddock

Test pits TP4-TP12 were advanced in both a gridded assessment and targeted assessment in the eastern paddock to capture the potential contamination from the historical uses of the site as residential property and to target the area were friable asbestos had been previously identified.

Laboratory results were either below the PQL or below the adopted site assessment criteria for a commercial/industrial land use except of F2-Napthelene in sample TP9_0.0-0.1 which had a reported concentration of 64 mg/kg which is above the Ecological Screening Levels (ESL). TP9 was identified in

the middle of the paddock away from the Cumberland Plain Woodland Forrest, which is located in the current RMA land that was inaccessible at the time of the DSI works. It is understood that the proposed development will significant change the appearance of the site with portions of the site covered by up to several metres of imported soils. This minimises the effect of the TRHs on the ecological areas of the site as the location of the exceedance and future site use makes it negligible. Although there were signs of contamination noted in TP7 with dark fill material and potential incinerator waste the material did not record any concentrations of potential contaminants above the adopted site assessment criteria. Based on these lab findings and field observations, no impact associated with the Eastern Paddock area was identified.

15.5.1 Friable Asbestos Area

During a site walkover friable asbestos and ACM fragments were identified in the north eastern portion of this area. Friable asbestos fragments were noted on the surface which triggered an emergency temporary covering of the area in geo fabric material. The friable asbestos is likely associated with historical structures or the importation of fill to backfill service trenches within this area. This area is currently being managed in the short term through the application of an AMP, installation of geofabric material and erection of a barrier with asbestos signage. This area requires further consideration as it is noted several services including fibre optics, water and electrical infrastructure are located within the impacted zone. It is understood that this area cannot be covered due to the infrastructure present which requires service providers to have access at all times. The services pose an additional issue, as the excavation and disturbance of soils in this area are limited to several metres from the service (depending on the service). It is recommended that a site walkover with all relevant stakeholders is undertaken to appropriately understand the requirements of each service provider to tailor a solution for this location.

15.6 Stockpiles

Stockpile on site were sampled to capture potential contaminants that could have been introduced on site through dumping of unknown material. All stockpiles had ACM fragments identified however all laboratory chemical analysis results were either below the PQL or the adopted site assessment criteria for commercial/industrial land use. It would appear that asbestos materials outside of the friable area noted in the north east of site are predominantly comprised of bonded asbestos fragments. It is understood that an Asbestos Management Plan is currently in place to manage asbestos risks on site. Based on visual and laboratory data, no further impact associated with the stockpiled material was identified.

16 Quality Assurance and Quality Control

Prensa implements project specific quality assurance/quality control (QA/QC) procedures to improve transparency, consistency, comparability, completeness, and confidence in the data collected. Field and laboratory QA/QC procedures, results and compliance with DQIs define the acceptable level of error required for this assessment are provided in **Appendix F**.

17 Conclusions

Based upon the investigation undertaken, the following comments can be made:

- The ESL exceedances noted on site are not considered to be in an ecologically significant area for flora and fauna, additionally given that the majority of the site is to be filled with imported material the ESL exceedances are not considered to be applicable;
- While no exceedances were noted in the samples targeting the UST, deeper excavation of the area was not possible at the time and there is potential for contamination from the UST at depth to exist which has not been identified during this investigation;
- An area of land owned by the RMA was not accessible for intrusive works at the time of the investigation. Therefore, there is potential for contamination to exist in this area that has not been identified during this investigation;
- Bonded fragments were identified in several stockpiles across the site. The overall risk of bonded asbestos identified on site is currently being managed by Blacktown City Council through ongoing works and the AMP. The asbestos on site does not preclude the ongoing use of the site as a cemetery however all works will need to consider and factor in the potential presence of asbestos identified on site;
- Friable asbestos was noted within the north east corner of the site. It is understood that the friable area has been covered and is currently being managed in the short term however due to the presence of several services and also the requirement to undertake works in this area, further consideration is required in appropriately managing this area.
- It should also be noted that the sampling density is below that required in Australian Standard 4482.1 for a site of this size, however due to the limited areas of environmental concern identified, 47 sampling locations is considered sufficient to address the objectives of the assessment.

Based on the fieldwork undertaken and a review of analytical results, Prensa considers that the contamination identified does not preclude the development and rezoning of the site to SP2 – Cemetery. It is however recommended that further works are undertaken to ensure workers are not at risk due to the potential presence of contaminants on site. Recommended works have been summarised in Section 18 below.

18 Recommendations

The following works are recommended for site:

- Additional investigation is recommended around the UST to determine if historical use of the UST has caused contamination;
- Additional investigation works in the RMA land to assess for the presence of contamination in these areas;
- It is recommended that further consideration and discussion around the friable area is undertaken with council and all stakeholders with services in the area to determine appropriate remediation/management; and
- It is recommended that the AMP for the site is updated to include the findings of this report in regards to potential asbestos locations and controls.

PAH	Polycyclic Aromatic Hydrocarbons
PID	Photo-ionisation Detector
POEO	Protection of the Environment Operations
PPM	Parts Per Million
PQL	Practical Quantitation Limit
QA/QC	Quality Assurance/Quality Control
RPD	Relative Percentage Difference
SEPP	State Environmental Planning Policy
SSP	Site Safety Plan
TRH	Total Recoverable Hydrocarbons
VOC	Volatile Organic Compounds

Appendix A: Data Quality Objectives

Data Quality Objectives

X1. Step 1 - State the Problem

APP Corporation are proposing to rezone the site to SP1 Cemetery. A Preliminary Site Investigation (PSI) (Ref: *PSI St Bartholomew's Cemetery Expansion Lands, Prospect NSW*) (Prensa February 2018) was previously undertaken which concluded that there was potential for contamination to exist at the site associated with former and current site activities.

X2. Step 2 - Identify the Decisions

The decisions to be made based on the results of the investigation were as follows:

What are the CoPC associated with potential soil contamination?

- Are CoPC present within soil, and if so, do they present an unacceptable risk to human health or the environment for the current zoning and land use?
- If soil contamination is present, does the site require remediation works and/or a management plan prior to divestment?

X3. Step 3 - Identify Inputs in the Decision

The inputs required to make the above decisions were as follows:

- Site setting and available background information;
- Selection of appropriate Tier 1 soil assessment criteria;
- Visual observations; and
- Field and laboratory analytical results.

X4. Step 4 - Define Boundaries of the Study

The geographical limits appropriate for the data collection and decision making in this investigation comprised the boundary of the site as shown on Figure 1 in the 'Figures' section of this report.

The temporal boundaries of the investigation (i.e. the areas of environmental concern) have been determined based on the data collected during this DSI and the PSI (Prensa February 2018).

X5. Step 5 - Develop a Decision Rule

The purpose of this step was to define the parameter of interest, specify the action level and combine the outputs of the previous DQO steps into an 'if/then' decision rule that defines the conditions that would cause the decision maker to choose alternative actions.

If the levels of contaminants of potential concern in soil were below the adopted soil assessment criteria, the risk to human health and the environment could be considered to be low for that land use.

If concentrations of contaminants in soil exceed the adopted soil assessment criteria, consideration for statistical analysis of the dataset should be undertaken to support the need or otherwise for further assessment, remediation or site management. These decision rules include the 95% upper confidence limit (UCL) of the mean contaminant concentration being less than the adopted site assessment criteria, the standard deviation being less than 50% and no individual concentration being in excess of 250% of the site assessment criteria (for similar soil types).

X6. Step 6 - Specify Limits on Decision Errors

The acceptable limits on decision errors applied during the DSI and the manner of addressing possible decision errors were developed based on the data quality indicators (DQIs) of:

- Accuracy: a quantitative measure of the closeness of reported data to the true value;
- Comparability: a qualitative parameter expressing the confidence with which one (1) data set can be compared with another;
- Completeness: a measure of the amount of useable data (expressed as %) from a data collection activity;
- Representativeness: the confidence (expressed qualitatively) that data are representative of each media present on the site; and
- Precision: a quantitative measure of the variability (or reproducibility) of data.

X7. Step 7 - Optimise the Design

The purpose of this step was to identify a resource-effective data collection design for generating data that satisfies the DQOs.

This assessment was designed considering the information provided during the request for proposal.

A proposal was prepared for the DSI which outlined a proposed scope. The methodology within the proposal was reviewed at critical times during the project and amended where necessary based on site conditions, unexpected finds, professional judgement and liaison with APP Corporation. The methodology adopted to satisfy the DQOs is described in detail in Section 12.

To ensure the design satisfied the DQOs, DQIs (for accuracy, comparability, completeness, precision and reproducibility) were established to set acceptance limits on field methodologies and laboratory data collected.

X8. Data Quality Indicators

A summary of the field and laboratory DQIs for the DSI are provided in Table A1.

Table A1: Data Quality Indicators (DQIs)

Field Considerations	Laboratory Considerations	Comments
	Accuracy (bias)	
Work instructions (WI) are appropriate and have been complied with.	Analysis of: • Trip blanks; • Rinsate blanks; • Method blanks;	Bias introduced: • By chemicals during handling or transport; • From contaminated equipment; • During laboratory analysis;

Table A1: Data Quality Indicators (DQIs)

Field Considerations	Laboratory Considerations	Comments
	• Matrix spikes; • Surrogate spikes; • Reference material; • Laboratory control samples; and • Laboratory-prepared spikes.	• During laboratory preparation and analysis (may be high or low); • During laboratory preparation and analysis (may be high or low); • Precision of preparation of analytical method; • Precision of preparation of analytical method; and • During collection/transport (may be high or low).
	Comparability	
Same WIs used on each occasion. Experienced sampler. Climatic conditions (temperature, rainfall, wind). Same types of samples collected (filtered, size fractions).	• Sample analytical methods used (including clean-up). • Laboratory practical quantification limits (PQLs) (justify /quantify if different). • Same laboratories (justify /quantify if different). • Same units (justify /quantify if different).	• Same approach to sampling (WIs, holding times). • Quantify influence from climatic or physical conditions. • Samples collected, preserved, handled in same manner (filtered, same containers).

Table A1: Data Quality Indicators (DQIs)

Field Considerations	Laboratory Considerations	Comments
	Completeness	
Critical locations sampled. WIs appropriate and complied with. Experienced sampler. Documentation correct.	Critical samples analysed in accordance with the tender response. Analytes sampled in accordance with scope of works. Appropriate methods and PQLs. Sample documentation correct. Sample holding times complied with.	The required percentage completeness should be specified in the scope of works. Required data must be obtained from critical samples and CoPC. Incompleteness is influenced by: • Field performance problems (access problems, difficulties on site, damage); • Laboratory performance problems (Matrix interference, invalid holding times); and • Matrix problems.
	Representativeness	
Appropriate media sampled according to the scope of works. Media in the scope of works sampled.	Samples analysed according to the tender response.	• Samples must be collected to reflect characteristics of each medium. • Sample analysis must reflect properties of field samples. • Homogeneity of the samples. • Appropriate collection, handling, storage and preservation. • Detection of laboratory artefacts, e.g. contamination blanks.
	Precision	
WIs appropriate and complied with.	Analysis of: • Laboratory and inter-laboratory duplicates; • Laboratory prepared trip spikes; and • Field duplicates.	• Measured by the coefficient of variance or standard deviation of the mean or Relative Percentage. • Field duplicates measure field and laboratory precision Difference (RPD) calculations. • Variation in RPDs can be expected to be higher for organics, low concentrations (<5 x laboratory PQL) or non-homogenous samples.

Acceptable limits adopted for data quality indicators for this DSI are outlined in Table A2.

Table A2: Acceptable Limits of Data Quality Indicators

Item	Acceptable Limit
Analysis of blind (intra-laboratory) duplicates and split (inter-laboratory) duplicates	Rate of 1:20 primary samples for the same analysis of primary samples; Calculation of relative percentage differences between primary and duplicate samples, the results of which to be less than: • 80% (where the average concentration was 1-10 x laboratory PQL); • 50% (where the average concentration was 10-30 x laboratory PQL); and • 30% (where the average concentration was > 30 x laboratory PQL).
Analysis of rinsate blanks	Rate of one sample per batch; and Results less than the laboratory PQL.
Analysis of trip blanks	Rate of one sample per batch; and Results less than the laboratory PQL.
Analysis of trip spikes	Rate of one sample per batch; and Results between 70%-130%.
Analysis of laboratory blanks, spikes, surrogates, reference and control samples	Laboratory specific
Laboratories and methods used	National Association of Testing Authorities accredited.
Sample PQLs	Results less than the adopted assessment criteria; justify/quantify if different.

Appendix B: Photographs

Photo 2. SP01 at the end of Tarlington Place

Photo 3. SP02 in the north eastern corner of the site

Photo 4. SP03 in the south western corner of the site

Photo 5. SP04 on the Western perimeter of the site

Photo 6. UST fill points near the base of the vent pipe

Photo 7. Septic tank identified at the rear of the post office

Photo 8. Brick pit located at the rear of the post office

Photo 9. Asbestos containing fibre cement sheeting

Photo 10. Asbestos containing fibre cement sheeting

Photo 11. Black discoloured soils were noted at TP7

Photo 12. Surface scrapes taken surrounding TP7 to delineate the extent of the waste

Appendix C: Assessment Criteria

Soil Assessment Criteria

X1. Human Health

Health Investigation Levels (HILs)

HILs were deemed applicable for assessing human health risk via all relevant exposure pathways of exposure for metals and organic substances. HILs are concentrations below which contaminants in soils are not considered to adversely affect human health.

Health Screening Levels (HSLs)

Soil HSLs have been developed for selected petroleum compounds and fractions and were considered applicable to assessing human health risk via vapour intrusion and inhalation. The HSLs depend on specific soil physicochemical properties, land use scenarios, and the characteristics of building structures. They apply to different soil types, and depths below surface to >4 m BGL. Criteria relevant to a clayey soil type and from various depths were selected.

Soil HSLs were also adopted from CRC CARE 2011 to assess the exposure pathway of direct contact (oral ingestion, dermal contact and dust inhalation) for commercial / industrial workers and shallow trench workers (maximum trench depth of 1.0 m) and vapour intrusion for intrusive maintenance workers. As a conservative approach, a clayey soil type and depth of 0-<2 m was adopted.

X2. Ecological

Ecological Investigation Levels (EILs)

Ecological Investigation Levels (EILs) have been developed for selected metals and organic substances and are applicable for assessing risk to terrestrial ecosystems. EILs depend on specific soil physicochemical properties and land use scenarios and generally apply to the top 2.0 m of soil.

Site specific Tier-1 EILs for copper, chromium (III), nickel and zinc were calculated from site specific data. Site specific Tier-1 EILs for these analytes would be considered to be within the ranges outlined in Table C1, which are based on a predicted range of ambient background concentrations (ABC) plus and a range of added contaminant limits (ACL) derived from site specific criteria.

Site specific EILs are based on a pH of 5 and a Cation Exchange Capacity of 16 (Rounded to 20) assessed from soils on site.

Table C1: Site Specific EIL Ranges (mg/kg)

	Range of ABCs1		Range of ACLs2		Tier-1 Site Specific EIL Ranges	
	Min	Max	Min	Max	Min	Max
Copper						
Commercial Industrial			**85**	**1,200**	**85**	**150**
Chromium						

Commercial Industrial	**130**	**660**	**430**	**1000**
Nickel				
Commercial Industrial	*55*	*960*	*170*	*490*
Lead				
Commercial Industrial	*1,800*	*1,800*	*1800*	*1800*
Zinc				
Commercial Industrial	110	2,000	70	360

[1] Predicted ambient background soil concentrations, based on the equations from Hamon et al. (2004). Adopted from NEPM 2013 Schedule B5b)

[2] Adopted from NEPM 2013 Schedule B1

X3. Ecological Screening Levels (ESLs)

ESLs are concentrations of contaminants above which further appropriate investigation and evaluation will be required. They were developed for select petroleum hydrocarbons; they depend on specific soil physicochemical properties and land use scenarios and generally apply to the top 2.0 m of soil (NEPM 2013). Based on the fine grain soils encountered, ESLs for fine grained soils were adopted.

SAMPLING METHOD Excavator
SAMPLING DATE 16/03/2018
SAMPLING LOCATION TP47
TOTAL DEPTH (m) 1.0

LOGGED BY MXJ

COMMENTS Surface Cover: Grass

Depth (m)	Samples	Moisture	PID	Graphic Log	Material Description	Additional Observations
0	TP47 - 0.0-0.1	D	3.2		NATURAL: SILTY CLAY, soft/brittle, rootlets and plant matter throughout	No odour No staining
0.1						
0.2						
0.3					NATURAL: CLAY, stiff, red clay	
0.4						
0.5						
0.6						
0.7						
0.8					NATURAL: CLAY, grading to natural grey clay with red/orange mottling - brittle	
0.9	TP47 - 0.9-1.0	D	1.3			
1					Termination Depth at:1.0 m Target Depth Reached	
1.1

Sample Receipt Advice

Company name:	**Prensa Pty Ltd NSW**
Contact name:	Darren Fernandez
Project name:	PROSPECT CONTAM ASSESSMENT
Project ID:	57658
COC number:	Not provided
Turn around time:	8 Day
Date/Time received:	Mar 15, 2018 3:35 PM
Eurofins | mgt reference:	**589953**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☒ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Appropriate sample containers have been used.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Split sample sent to requested external lab.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

TP36_0.9-1.0,RB_1, RB_2 not received; analysis cancelled. Additional samples TP43_0.4-0.5 (BAG+JAR), 2xFB (WATER) placed on hold.

Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8400 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Darren Fernandez - darren.fernandez@prensa.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Mar 22, 2018	14 Day

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	No
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins | mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.
R20	This sample is a Trip Spike and therefore all results are reported as a percentage

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP068: Positive result has been confirmed by re-extraction and re-analysis.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

No. of samples analysed	: 3		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP068: Positive results have been confirmed by re-extraction and re-analysis.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

Appendix F: Quality Assurance/Control

Quality Assurance and Quality Control

X1. Field QA/QC

Sampling Procedures

Fieldwork was undertaken by Prensa personnel in accordance with Prensa Work Instructions which are based on industry accepted standard practice and NEPM 2013.

Sampling, decontamination and storage works were conducted in accordance with the Prensa Environmental Work Instructions.

Calibration certificates for the PID are provided in **Appendix G**.

Phosphate-free detergent was used to clean sampling instruments between sample locations. The sampling instruments were rinsed in deionised water and then sprayed with deionised water to minimise the potential for cross-contamination to occur.

Soil samples were placed in laboratory supplied jars, bags and bottles with Teflon lined lids and preservatives, where required. The samples were stored in ice cooled eskies before being transported to the laboratory along with Chain of Custody documentation, which is included in **Appendix E**.

Quality Control Samples

Field Duplicate Samples

The purpose of duplicate samples were to estimate the variability of a given characteristic or contaminant associated with a population.

Field duplicate soil samples were collected from soil immediately adjacent to the primary sample by placing approximately equal portions of the primary sample into two (2) sample jars. Samples were labelled so as to conceal their relationship to the primary sample from the laboratory.

The blind and split duplicate samples analysed are outlined in Table F1.

Table F1: Field Blind and Split Duplicate Analysed

Medium	Primary Sample	Blind Replicate	Split Sample	Analysis
FILL	SP02-04	FD1	FD2	TRH, BTEX, PAH, metals
NAT	TP10_0.0-0.1	FD3	FD4	TRH, BTEX, PAH, metals
NAT	TP19_0.0-0.1	FD5	FD6	TRH, BTEX, PAH, metals
NAT	TP43_0.0-0.1	FD7	FD8	TRH, BTEX, PAH, metals
NAT	TP46_0.0-0.1	FD9	FD10	TRH, BTEX, PAH, metals

The quantity of duplicate samples analysed is in accordance with the frequency set in the DQI (Appendix A).

Relative percent differences (RPDs) were calculated for each of the duplicate samples analysed. RPDs were calculated by dividing the difference between the primary sample and duplicate sample by the average of the two, as shown below:

$$RPD = \frac{(X_1 - X_2)}{(X_1+X_2)/2} \times 100\%$$

Where: X_1 = Primary sample result; and

X_2 = Replicate sample result.

When calculating the RPDs, the following procedures were also considered:

- RPDs were only considered when a concentration was greater than the PQL; and
- In instances where results were greater than the PQL for the one (1) sample, but below PQL for the corresponding primary or duplicate sample, a result equal to the PQL value was adopted where necessary in order to make a calculation possible.

RPDs for duplicate samples were calculated and the results are attached in Table C in the 'Tables' section of this report. RPDs have also been summarised in Table F2 below.

Table F2: Field Blind and Split Duplicate RPD results

Medium	Primary Sample	Blind Replicate	Split Sample	Results
FILL	SP02-04	FD1	FD2	RPD results were within the acceptable ranges set out in the DQIs (Appendix A)
NAT	TP10_0.0-0.1	FD3	FD4	RPD results were within the acceptable ranges set out in the DQIs (Appendix A)
NAT	TP19_0.0-0.1	FD5	FD6	RPD results were within the acceptable ranges set out in the DQIs (Appendix A)
NAT	TP43_0.0-0.1	FD7	FD8	RPD results were within the acceptable ranges set out in the DQIs (Appendix A)
NAT	TP46_0.0-0.1	FD9	FD10	RPD results were within the acceptable ranges set out in the DQIs (Appendix A)

Based on the calculated RPDs the results were considered acceptable and the data was considered reliable.

Blank Samples

Trip blanks were collected and submitted for laboratory analysis as outlined in Table F3. The results for the blank samples are summarised in Table C in the 'Tables' section of this report and in the laboratory reports in **Appendix E**.

Trip blanks assess the potential for cross contamination during transits from the site to the laboratory. Samples were analysed for volatile compounds. The trip blank samples were prepared by the primary

laboratory, carried to the field unopened and subjected to the same preservation methods as the primary field samples.

Rinsate blanks consist of pre-preserved bottles filled with laboratory prepared water that is passed over decontaminated field equipment and then collected in containers used for the sampling process. Rinsate blanks were preserved in a similar manner to the original samples. The rinsate blank was a check on decontamination procedures.

No Rinsate Blanks were taken with sampling equipment not coming into direct contact with soils that were sampled. Additionally all gloves were changed between borehole locations and sample depths to ensure no cross contamination occurred.

A Field Blank was taken in the field to assess the contamination from field conditions. The field blank consists of a sample of analyte free water poured into a sample jar in the field, preserved and taken to the laboratory with the field samples. The Field blank was put on hold at the Laboratory.

Table F3: Blank Sample Analysis and Results

Type	Medium	Sample	Date	Analysis	Results
Trip Blank	Soil	TB_1	14/03/2018	TRH $C_6 - C_{10}$ and BTEX	Concentrations were less than the DQIs.
Trip Blank	Soil	TB_2	16/03/2018	TRH $C_6 - C_{10}$ and BTEX	Concentrations were less than the DQIs.
Trip Spike	Soil	TS_1	14/03/2018	TRH $C_6 - C_{10}$ and BTEX	Concentrations were less than the DQIs
Trip Spike	Soil	TS_2	16/03/2018	TRH $C_6 - C_{10}$ and BTEX	Concentrations were less than the DQIs

Based on the results, the quantity of blanks samples analysed conformed to the frequency set in the DQI (Appendix A).

Based on the results it can be considered that:

- Decontamination procedures were adequate and contaminants were unlikely to have been introduced by contact of the sampling equipment with the soil sampled; and
- Cross contamination from the atmosphere between transit of samples from the site to the laboratory was unlikely to have occurred.

X2. Laboratory Quality Assurance/Quality Control

The laboratories conducted their own internal quality program for assessment of the repeatability of the analytical procedures and instrument accuracy under their NATA accreditation. This included analysis of laboratory blank samples, duplicate samples, spike samples, control samples and surrogate spikes. The laboratory QA/QC procedures and results are described within the laboratory reports presented in **Appendix E**.

The laboratory internal QA/QC sample results were reviewed and were consistent with the laboratory's NATA guidelines. Furthermore, the adoption of the general advisory ranges for specific recoveries has been used to screen laboratory data. Where recoveries were outside these ranges the data was assessed in relation to specific laboratory comments, published industry 'norms' for specific parameters and/or the likely impact on the interpretation of the meaning of the results.

Based on the reported laboratory QA/QC samples and methods used, the results were considered to be acceptable.

X3. Quality Statement

The sampling methods (including sample preservation, transport and decontamination procedures) and laboratory methods followed during the assessment were consistent with Prensa Work Instructions and were found to meet the DQIs for this project. It was considered that the data was sufficiently collected and results can be relied upon for the purpose of this assessment.
