BY EMAIL

Dear Colby

Re: Contamination Assessment Lot 2 DP 838319 Wade Street Coolamon NSW 2701

I refer to the written instructions from yourself to undertake limited investigation and assessment of soil at the subject site for potential contamination. This assessment is for use only of Colby Farmer of Coolamon Shire Council for initial evaluation purposes and is not to be relied upon for any other purpose. No responsibility is accepted to any third party who may use or rely on the whole or any part of the content of this assessment. This letter format report has been prepared to minimise the cost to the client however, comprehensive reports can be prepared at an additional cost if required. Please find as follows a summary of the investigation and assessment.

1. McMahon Earth Science (McMahon) was engaged by Colby Farmer of Coolamon Shire Council to undertake an initial inspection, investigation and contamination assessment of vacant block of land at Lot 2 DP 838319 Wade Street Coolamon (the site) on 8 October 2019.

2. Coolamon Shire Council intends to purchase the site from State Rail, the current owners. After purchasing the site, Council intends to develop the land for light industrial purposes. Council have conducted their own research and enquiries and have assessed that there have been no known contaminated land uses/practices on the site (pers. comm. Colby Farmer 23 September 2019). A map of the location of the site and proposed development footprint can be seen in Attachment 1.

3. McMahon conducted a site inspection on 8 October 2019 which included a site walkover after a review of desktop information. The site landform is a low foot slope of recently formed Quaternary colluvium underlain by Ordovician Metasediments located at an elevation of approximately 250m AHD. There are no natural drainages nor registered groundwater bores on site. There are scattered pine and gum trees on site and groundcover is typical of unimproved ley ground. Based on such, McMahon assesses environmental receptors are limited from any potential contamination on site.

4. McMahon noted from the site inspection on 8 October 2019, relating to potential contamination:

- a) The site lies between the Junee-Hay railway line to the north and Wade Street to the south.
- b) Surrounding land use is commercial/industrial and residential.
- c) The site is a vacant block with some farm fencing along the northern boundary.
- d) There were two low, open man-made drainages traversing the site running to the south.
Both of these man-made drainages were dry at the time of inspection.
- e) The natural soil surface and subsurface was not disturbed, coloured or stained.
- f) There were no bonded asbestos containing material fragments identified on the soil surface.

- g) There was no disturbed vegetation.
 - h) There were no unusual odours.
 - i) There were some stockpiles of road gravel in the far western section of the site totalling <5m³
5. McMahon collected ten surface and three subsurface samples in a transect line across the site. These surface and subsurface samples were sent to a NATA accredited laboratory for analysis. The samples were analysed for heavy metals, pesticides (OCCs, SPs), hydrocarbons (TRH, PAHs PCBs), phenols, solvents (BTEXN) and asbestos. A map of the sample locations can be seen in Attachment 2.
6. The results of the analysis from the soil samples taken at the surface and subsurface returned contaminant levels below the adopted Tier 1 commercial/industrial risk criteria for human health and the environment, see Attachment 3. The laboratory reports can be seen in Attachment 4.
7. The QA/QC results from the laboratory are assessed to be:
- a) Within the withholding periods for all parameters.
 - b) Of a suitable quality to deem the results as reliable.

8. In conclusion the following assessment applies:

- a) From the available information as outlined in this letter format report, there is no qualitative or quantitative evidence of previous contaminating activities nor gross surface or subsurface soil contamination on site.
- b) Based on the above, McMahon assesses that the site is suitable for development as commercial/industrial land.
- c) If unexpected findings relating to potential contamination do occur during development, McMahon should be contacted for further investigation and assessment.

If you have any queries about the content of this letter format report, please contact the undersigned.

Yours sincerely

David McMahon CEnvP

Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EG048G: Poor spike recovery for Alkyl Hexavalent Chromium due to matrix interferences.
- EG048G: LOR raised for Alkyl Hexavalent Chromium on various samples due to sample matrix.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3,cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatures

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.
