The Australian Noise Exposure Forecast (ANEF) contours depicted on this chart are taken from the Draft Environmental Impact Statement for the Second Sydney Airport at Badgerys Creek (April 1985).

It should be noted that these ANEF contours are PREDICTIONS of the contours expected to occur when the airport is developed to its ultimate capacity. The calculations of these contours are affected by a number of variables, including:

- the volume of air traffic
- flight paths and altitude of arriving and departing traffic
- runway utilisation
- aircraft fleet mix
- aircraft performance
- weather conditions

The determination of these variables was based upon the best available information at the time of the preparation of the Draft EIS.
