1. Introduction

This report has been prepared on behalf of Mr K. Davies to present findings of a traffic and access assessment of the proposed residential subdivision of the site known as LOT 60 DP1090981 and LOTS 61 - 64 & 71 - 77 DP976708, 2 Brisbane Grove Road, Brisbane Grove.

The study has assessed existing traffic conditions, access arrangements, future traffic conditions and design compliance with applicable standards and policies.

The remainder of the report is set out as follows:

- Section 2 describes the existing traffic and parking conditions;
- Section 3 summarises the proposed development;
- Section 4 reviews the potential traffic impacts of the proposal; and
- Section 5 presents the conclusions

2. Existing Development / Conditions

The following presents a summary of existing site and traffic conditions.

2.1 Site Location

The proposed site for subdivision is located south of the Goulburn City Centre and south of the Hume Highway. The existing site is a greenfield site and does not generate any traffic. The location of the development site is shown in **Figure 1**.

Figure 1 - Site Location

Source: Nearmap

The site includes frontages to Brisbane Grove Road in the north, Braidwood Road in the west and Johnsons Lane in the south.

2.2 Existing Site Traffic Generation

As stated above the existing site is a greenfield site and does not generate any traffic.

2.3 Classification Criteria

It is usual to classify roads according to a road hierarchy in order to determine their functional role within the road network. Changes to traffic flows on the roads can then be assessed within the context of the road hierarchy. Roads are classified according to the role they fulfil and the volume of traffic they should appropriately carry. The RTA has set down the following guidelines for the functional classification of roads.

- Arterial Road – typically a main road carrying over 15,000 vehicles per day and fulfilling a role as a major inter-regional link (over 1,500 vehicles per hour)
- Sub-arterial Road – defined as secondary inter-regional links, typically carrying volumes between 5,000 and 20,000 vehicles per day (500 to 2,000 vehicles per hour)
- Collector Road – provides a link between local roads and regional roads, typically carrying between 2,000 and 10,000 vehicles per day (250 to 1,000 vehicles per hour). At volumes greater than 5,000 vehicles per day, residential amenity begins to decline noticeably.
- Local Road – provides access to individual allotments, carrying low volumes, typically less than 2,000 vehicles per day (250 vehicles per hour).

2.4 Existing Road Network

Braidwood Road – is a key collector road through the local area linking the Goulburn City Centre in the north (via an underpass under the Hume Highway) to regional suburbs in the south including Springfield and Tarago. Across the frontage of the site the road includes a single lane of travel in each direction with 1.0-1.5m wide asphalt shoulders. In the vicinity of the sub division site the road includes a posted speed limit of 100km/hr.

Brisbane Grove Road – is a local east-west street linking Braidwood Road in the west with Windellama Road in the east. The intersection of Braidwood Road / Brisbane Grove Road includes a priority-controlled intersection. Brisbane Grove Road includes a pavement width of 5.5m – 6.0m and unformed shoulders on either side. No formal speed limit is posted in the street and thus whilst local in nature also includes a speed limit of 100km/hr.

Johnsons Lane – is a local street linking Braidwood Road in the west and forms a cul-de-sac in the east. The intersection of Braidwood Road / Johnsons Lane also includes a priority-controlled intersection. Brisbane Grove Road includes a pavement width of 5.5m – 6.0m and unformed shoulders on either side. No formal speed limit is posted in the street and thus whilst local in nature also includes a speed limit of 100km/hr.

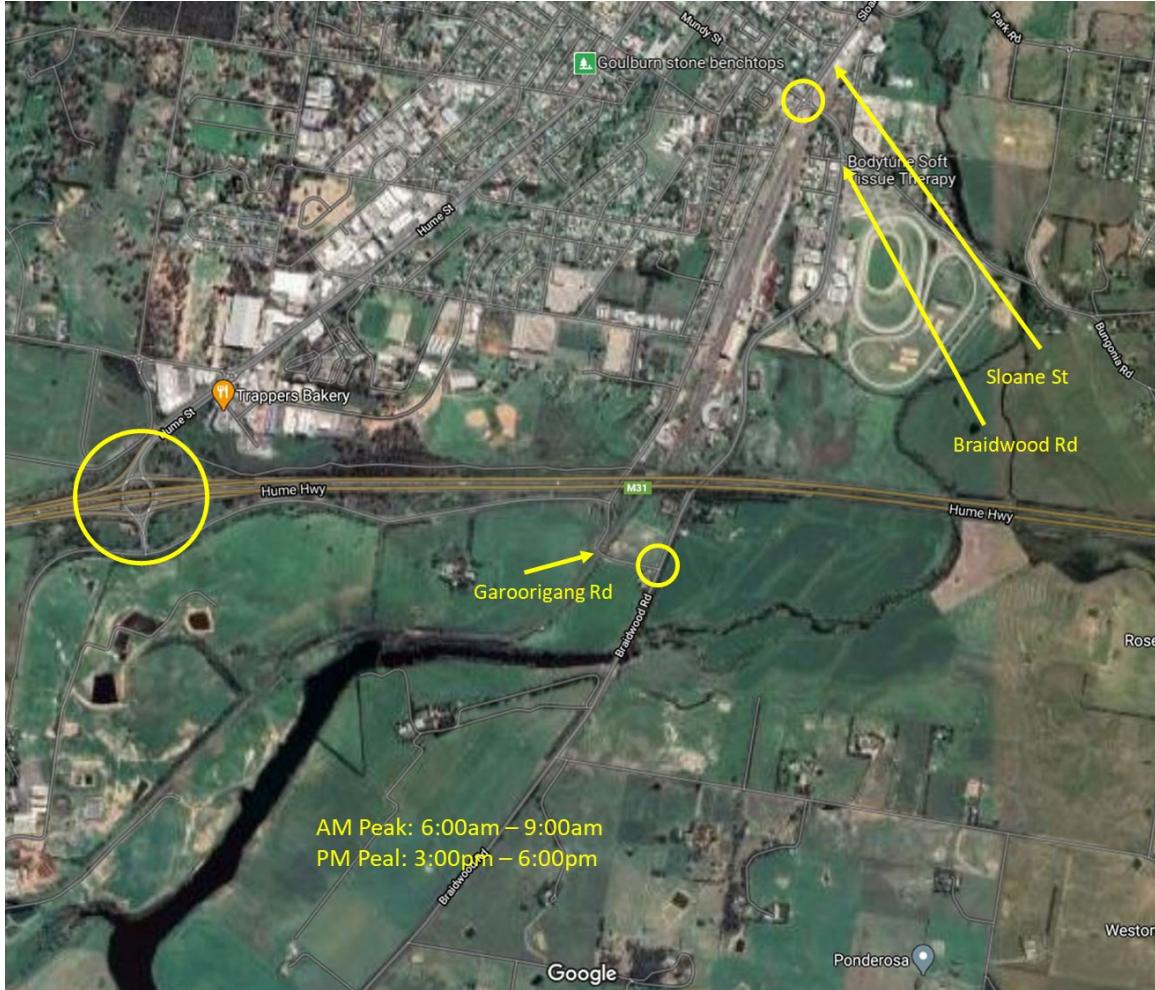

Garoorigang Street – is a local street linking Braidwood Road to the Hume Street grade separated interchange roundabout. The street provides an underpass (2.7m height clearance) and includes a priority-controlled intersection with Braidwood Road. The street includes a pavement width of approximately 6.5m with unformed shoulders and a posted speed limit of 80km/hr.

2.5 Existing Traffic Flows

To gauge existing traffic flows on the surrounding road network an intersection counts were undertaken at a number of locations around the development site. The identified locations for weekday AM / PM peak period counts are shown below in **Figure 2** and include:

1. Hume Highway / Hume Street Grade Separated Interchange
2. Sloane Street / Braidwood Road / Mundy Street; and
3. Braidwood Road / Garoorigang Street

Figure 2 – AM / PM Peak Period Count Locations

Copies of all intersection counts can be found in **Appendix A** of this report. The peak flows by direction in each street at each intersection are summarised below.

Table 1 – Existing Weekday Peak Period Volumes in vicinity of site (veh/hr)

Road	Location	Weekday AM		Weekday PM	
		NB/EB	SB/WB	NB/EB	SB/WB
Hume Street	North of Hume Highway	370	392	529	444
	South of Hume Highway	68	41	161	50
Garoorigang Street	West of Braidwood Road	21	74	55	80
Braidwood Road	East of Sloane Street	175	127	308	250
	North of Garoorigang Street	63	89	83	94
	South of Garoorigang Street	128	101	149	135

From **Table 1** it can be seen that existing flows on surrounding roads are in generally in line with their classification. Further, peak hour traffic volumes in Braidwood Road south of Garoorigang Street are quite low in the vicinity of the development site.

On the matter of mid block capacity of roads surveyed versus demands, the following mid block capacities are typical by road type.

Table 2 – Austroads 2020 Lane Mid Block Capacities

Type of lane	One-way mid-block capacity (pc/h)
Median or inner lane	
Divided road	1000
Undivided road	900
Middle lane (of a 3 lane carriageway)	
Divided road	900
Undivided road	1000
Kerb lane	
Adjacent to parking lane	900
Occasional parked vehicles	600
Clearway conditions	900

Source: Austroads (2020)

Therefore, the existing volume capacity ratios of each road surveyed around the development site is shown below in **Table 3**.

Table 3 – Volume / Capacity Analysis of Roads Surrounding Development Site

Road	Two Way Mid Block Capacity	AM Peak Hour Two Way Flow	AM Peak V/C	PM Peak Hour Two Way Flow	PM Peak V/C
Braidwood Road – South of Garoorigang Street	1,800	229	0.128	284	0.158
Garoorigang Street – West of Braidwood Road	1,800	95	0.052	135	0.075
Hume Street – South of Hume Highway	1,800	109	0.061	211	0.117

From **Table 3** it is evident that roads immediately in the vicinity of the development site have significant spare mid block capacity.

2.6 Existing Intersection Operating Conditions

All intersections surveyed have been analysed using the Sidra Intersection analysis program. Sidra Intersection determines the average delay that vehicles encounter, the degree of saturation of the intersection, and the level of service. The degree of saturation is the ratio of the arrival rate of vehicles to the capacity of the approach. Sidra Intersection provides analysis of the operating conditions which can be compared to the performance criteria set out in **Table 4**.

Table 4 – Level of Service Criteria

Level of Service	Average Delay per Vehicle (secs/veh)	Signals & Roundabouts	Give Way & Stop Signs
A	less than 14	Good operation	Good operation
B	15 to 28	Good with acceptable delays & spare capacity	Acceptable delays & Spare capacity
C	29 to 42	Satisfactory	Satisfactory, but accident study required
D	43 to 56	Operating near capacity	Near capacity & accident study required
E	57 to 70	At capacity; at signals, incidents will cause excessive delays Roundabouts require other control mode	At capacity, requires other control mode
F	> 70	Extra capacity required	Extreme delay, traffic signals or other major treatment required

Adapted from RTA Guide to Traffic Generating Developments, 2002.

For roundabouts and priority intersections, the reported average delay is for the individual movement with the highest average delay per vehicle. At signalised intersections, the reported average delay is over all movements. The two intersections surveyed have been modelled as a network given their close proximity to each other. The existing weekday and weekend day intersection operating conditions are presented in **Table 5**. Average delay is expressed in seconds per vehicle. It should be noted that given their close proximity the intersections have been modelled as a network within SIDRA.

Table 5 – Existing Weekday AM / PM Intersection Operating Conditions

Intersection	Control	Weekday AM Peak		Weekday PM Peak	
		Av Delay	LOS	Av Delay	LOS
Braidwood Rd / Sloane St	Priority	8.6	A	12.4	A
Braidwood Rd / Garoorigang St	Priority	6.1	A	6.3	A
Hume St / Garoorigang St	Roundabout	10.3	A	10.3	A

Avg Delay (sec/veh) is over all movements at signals, and for worst movement at priority and roundabouts

From **Table 5** it is noted that all intersections in the vicinity of the development site currently operate at a satisfactory level of service with spare capacity.

Copies of the SIDRA outputs are provided in **Appendix B** of this report.

2.7 Goulburn Mulwaree Council Urban Fringe Strategy

It is noted that the subject site is located within the land confines identified in the Goulburn Mulwaree Council Urban Fringe Strategy which is described below:

This Urban and Fringe Housing Strategy (Strategy) investigates and identifies areas suitable for the provision of additional housing to assist Goulburn Mulwaree Council (Council) meet the housing demands generated by expected continued population growth. The Strategy has been prepared in response to both the limited supply of residential land available to meet the short and medium term needs of the community and the directions of the South East and Tablelands Regional Plan 2036.

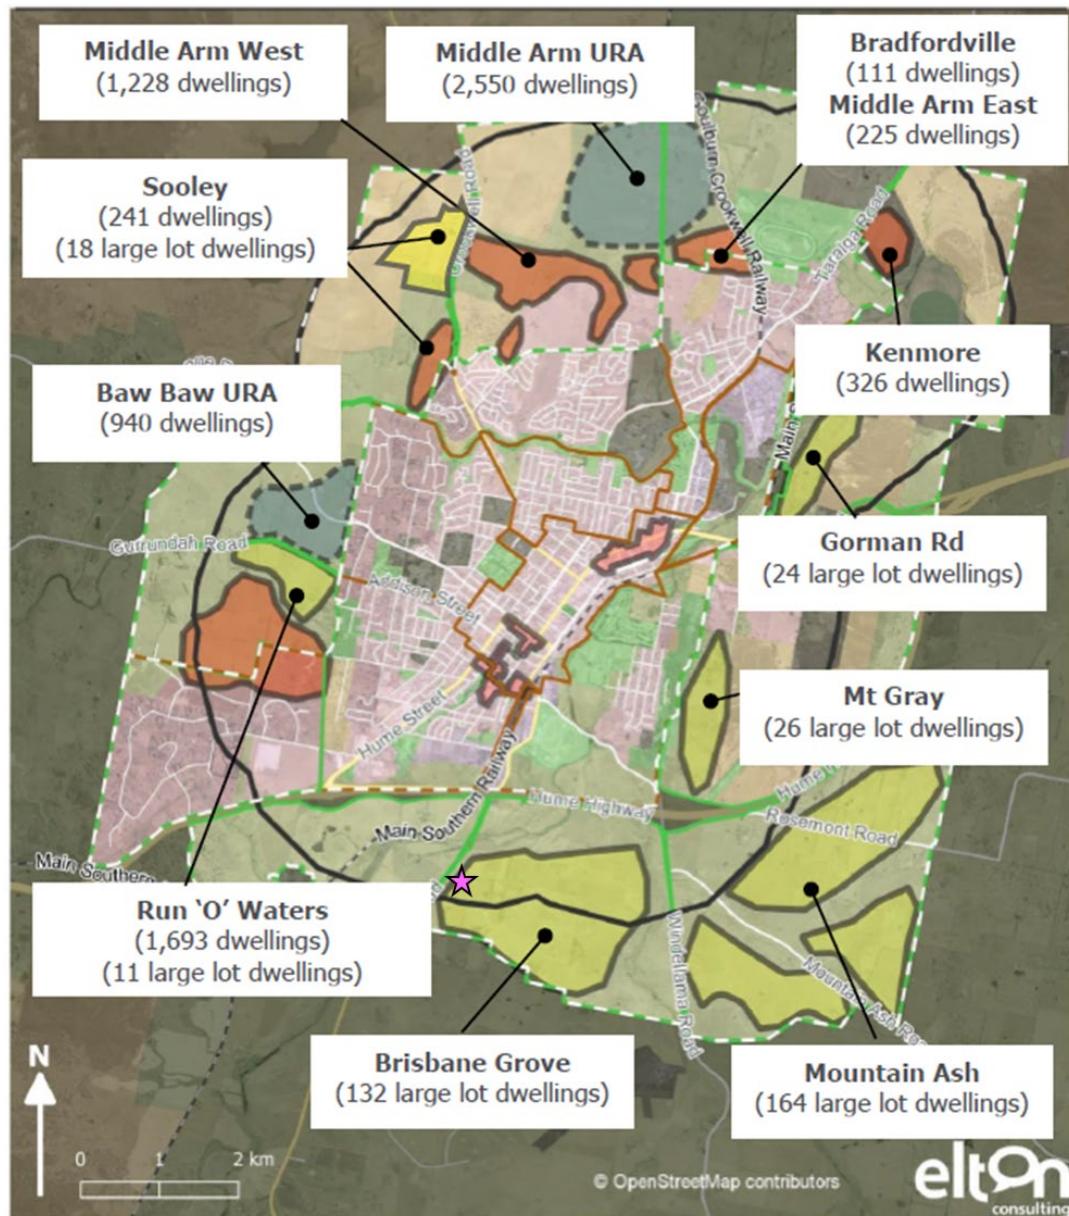

The scope of the Strategy includes looking at the urban areas of Goulburn and Marulan and identifying opportunities for an additional recommended 3,500 dwellings over the next 18 years to 2036.

The Strategy also considers land for large lot residential development (typically greater than 2ha and often referred to as rural residential development) particularly on the urban fringe of Goulburn.¹

The location of the development site in the context of the overall areas identified for increased housing is shown below in

¹ Goulburn Mulwaree Council Urban Fringe Strategy – Elton Consulting 2020

Figure 3 – Site Location within Goulburn Mulwaree Council Urban Fringe Strategy Precincts

2.8 Journey to Work Census Assessment

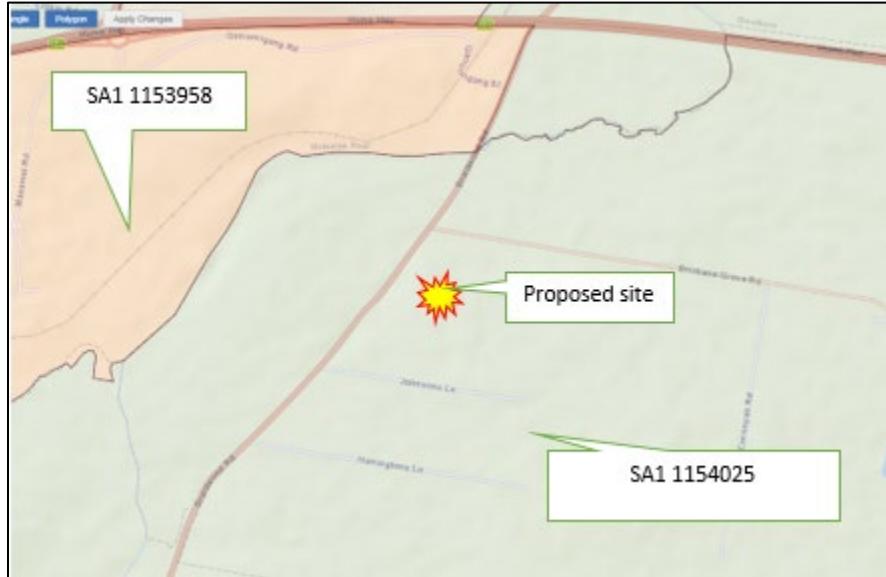

The following presents an assessment of the existing travel to work characteristics of the Goulburn area including the subject site. This provides an indication of the potential travel patterns of the residents of the proposed subdivision.

The 2016 Census of Population and Housing collected information about how people travelled to work on Census day. In combination with information about where the person worked, it is possible to use the census data to provide an indication of how people travelled to work and where they travelled to.

Census data is reported at different levels of spatial resolution, from the small scale mesh blocks and statistical area level one (SA1) of around 150 to 200 dwellings, up the aggregated SA4, comprising many tens of thousands of dwellings.

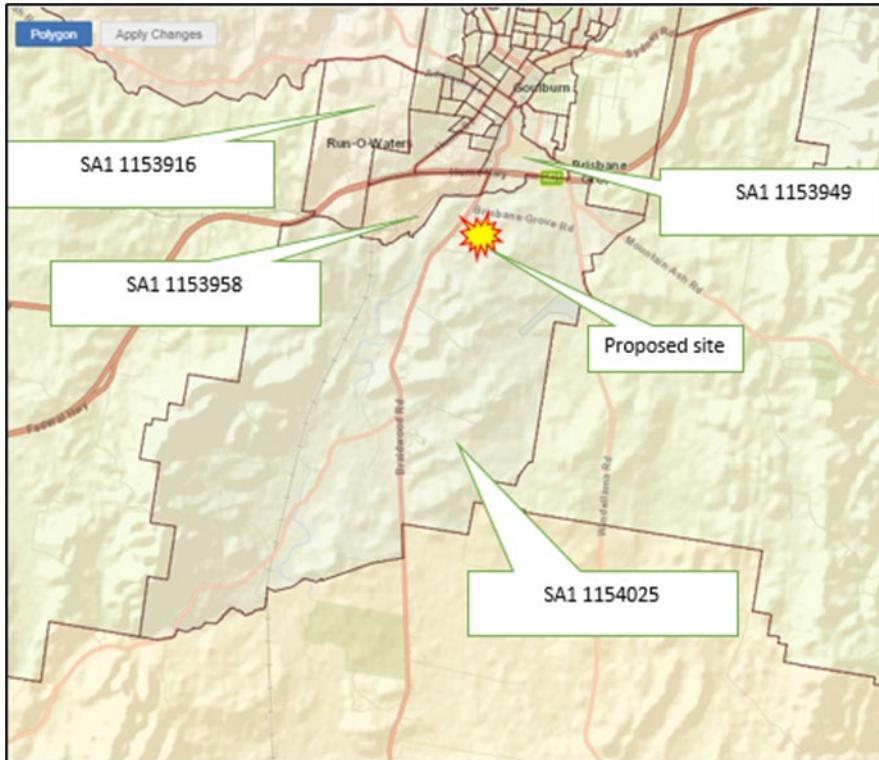

For this analysis the proposed site is located in SA1 1154025, as shown in [Figure 4](#).

Figure 4 – Proposed site and SA1 1154025

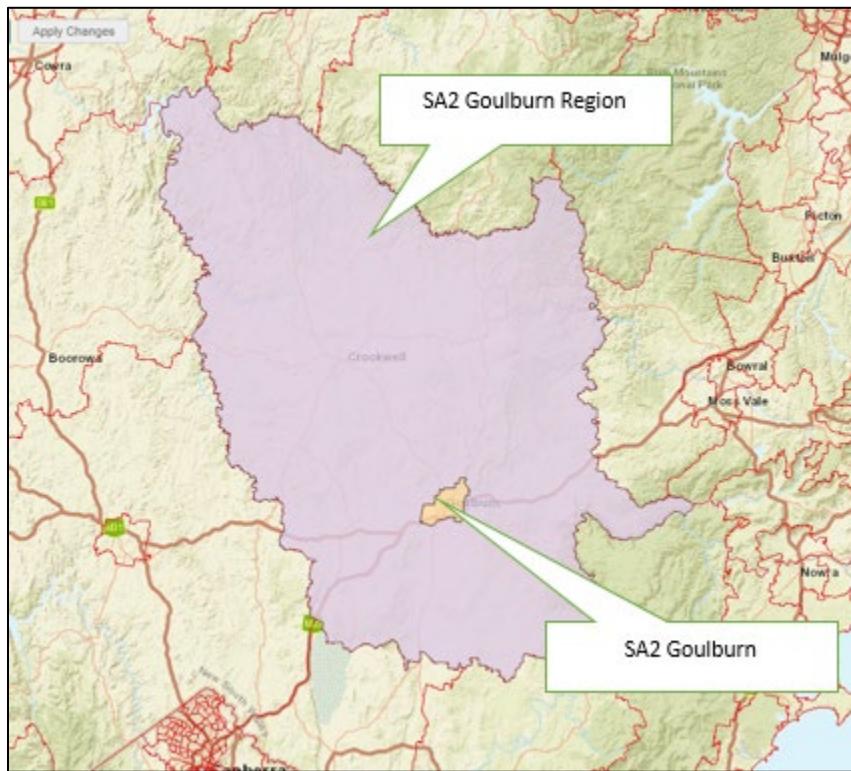

Site is shown within the context of Goulburn and other SA1s in the immediate surrounds in [Figure 5](#).

Figure 5 – Proposed site within context of Goulburn

The next level of the statistical hierarchy, SA2, is shown in [Figure 6](#).

Figure 6 – Statistical area level 2 (SA2) around Goulburn

This indicates that the main urban centre of Goulburn is contained within SA2 Goulburn, and this in turn is surrounded by SA2 Goulburn Region. The number and type of dwellings in these two SA2s are summarised in [Table 6](#).

Table 6 – Dwelling types, SA2-Goulburn and SA2-Goulburn Region, 2016 Census

Dwelling type	SA2 - Goulburn		SA2 - Goulburn Region	
	No.	%	No.	%
Occupied private dwellings	9,059	89%	5,036	74%
Unoccupied private dwellings	1,036	10%	1,777	26%
Non-private dwellings	71	1%	17	0%
Migratory	0	0%	0	0%
Off-shore	0	0%	0	0%
Shipping	0	0%	0	0%
Total	10,166	100%	6,830	100%

Source: ABS TableBuilder Pro

This summary indicates that almost all dwellings in each SA2 are private dwellings, with SA2 – Goulburn having a lower proportion (10% versus 26%) of unoccupied private dwellings than SA2 – Goulburn Region. This is likely due to a smaller proportion of holiday homes in Goulburn than in Goulburn Region. Also, it should be noted that despite SA2 - Goulburn being much smaller in area than SA2 - Goulburn Region, it has substantially more dwellings.

The distribution of dwelling structures in these two SA2s is shown in **Table 7**.

Table 7 – Distribution of dwelling structures, SA2-Goulburn and SA2-Goulburn Region, 2016 Census

Dwelling structure	SA2 - Goulburn		SA2 - Goulburn Region	
	No.	%	No.	%
Separate house	8,335	82%	6,419	94%
Semi-detached, row or terrace house, townhouse etc. 1 storey	912	9%	72	1%
Semi-detached, row or terrace house, townhouse etc. 2+ storeys	153	2%	9	0%
House or flat attached to a shop, office, etc.	48	0%	27	0%
Flat or apartment attached to a house	5	0%	0	0%
Flat or apartment in a one or two storey block	407	4%	8	0%
Flat or apartment in a three storey block	92	1%	0	0%
Flat or apartment in a four or more storey block	0	0%	0	0%
Caravan	39	0%	63	1%
Cabin, houseboat	31	0%	87	1%
Improvised home, tent, sleepers out	11	0%	79	1%
Not applicable	71	1%	17	0%
Not stated	65	1%	50	1%
Total	10,169	100%	6,831	100%

Source: ABS TableBuilder Pro

This analysis indicates that in the more urban SA2-Goulburn, separate dwelling structures are still dominate, although there are appreciably more town houses and apartments than in SA2-Goulburn Region. The mode shares for the journey to work for these two SA2s are summarised in **Table 8**.

Table 8 – Mode share for JTW from SA2-Goulburn and SA2-Goulburn Region, 2016 Census

Mode	SA2-Goulburn		SA2-Goulburn Region	
	No.	% of those who commuted	No.	% of those who commuted
Train	25	0.3%	24	0.6%
Bus	80	0.9%	23	0.6%
Ferry	0	0.0%	4	0.1%
Tram	0	0.0%	0	0.0%
Car Dr	7,116	82.2%	3,442	82.4%
Car px	704	8.1%	228	5.5%
Motorbike/scooter	44	0.5%	43	1.0%
Bicycle	25	0.3%	5	0.1%
Walked	422	4.9%	197	4.7%
Other	241	2.8%	213	5.1%
DNGTW	978		595	
Worked at home	256		746	
NS	112		86	
Total	10,003	100.0%	5,606	100.0%
Travelled	8,657		4,179	

DNGTW – did not go to work; NS – not stated

Source: ABS TableBuilder Pro

The above mode shares indicate that car as driver is the most common JTW mode, in combination with car passenger, it accounted for some 90% of commuter trips.

The distribution of JTW trips was examined using SA2 to local government area (LGA) geography. We have coded LGAs in Greater Sydney to an area termed Gt Sydney to make the analysis more useful and easier to follow.

Table 9 – Commuter travel patterns from usual residence at SA2 to place of work LGA, car driver and car passenger, 2016 Census

Place of work LGA	From SA2 Goulburn		From SA2 Goulburn Region	
	No.	%	No.	%
Goulburn Mulwaree (A)	6,200	82%	1,748	48%
ACT	504	7%	283	8%
No Fixed Address (NSW)	309	4%	265	7%
Wingecarribee (A)	135	2%	205	6%
Gt Sydney	121	2%	150	4%
Queanbeyan-Palerang Regional (A)	118	2%	57	2%
Upper Lachlan Shire (A)	109	1%	900	25%
Yass Valley (A)	26	0%	20	1%
Wollongong (C)	11	0%	17	0%
Griffith (C)	7	0%	0	0%
Shellharbour (C)	5	0%	5	0%
Bathurst Regional (A)	5	0%	0	0%
Cabonne (A)	5	0%	0	0%
Hilltops (A)	4	0%	12	0%
Shoalhaven (C)	4	0%	10	0%
Albury (C)	3	0%	0	0%
Wagga Wagga (C)	3	0%	0	0%
Total	7,569	100%	3,672	100%

Note: 'No fixed address' includes contractors using home as their work base, including transport workers, trades, sales reps
Source: ABS TableBuilder Pro

As mentioned previously the site is situated in SA2 Goulburn Region, but at the southern edge of SA2 Goulburn and close to the urban location of Goulburn. The travel characteristics by occupants of the proposed housing at the site are more likely to mirror the existing residents of SA2 Goulburn as opposed to existing residents of SA2 Goulburn Region.

The above analysis indicates that a very large proportion of commute trips by car from SA2 Goulburn are to LGA of Goulburn at **82%**, which is not surprising given that, in approximate terms, the urban centre of Goulburn is relatively isolated from surrounding employment concentrations, being some 80 to 90km from the ACT and a similar distance from the Southern Highlands (which is a small employment centre). The ACT is the second highest destination at 7%, 'no fixed address' for place of work is the third highest at 4%, with Wingecarribee and Gt Sydney accounting for a combined 4%.

In terms of traffic assignment from the proposed site, the above analysis suggests the following approximate aggregations of demand along desire lines, with 'no fixed address' distributed across places:

- **Braidwood Road north, 80%**
 - into Goulburn and further north into SA2 Goulburn Region 80%
- **Braidwood Road south, 5%**
 - South into SA2 Goulburn Region: 5%
- **Hume Highway south/west, 9%**
 - ACT: 7%
 - Queanbeyan-Palerang: 2%
 - Yass: 0.3%
- **Hume Highway north/east, 6%**
 - Wingeecarribee: 2%
 - Gt Sydney: 2%
 - Wollongong: 0.1%

The above distribution will be utilised in the future traffic conditions assessment.

3. The Proposed Development

The key components of the proposed development are summarised below

- A total of sixteen (16) rural residential lots (> 2.0Ha in size).
- New internal local road connection to Brisbane Grove Road serving 10 of the proposed 16 lots
- Six (6) lots fronting Johnsons Lane
- No direct vehicle access to Braidwood Road

Plans of the proposed development can be found in **Appendix C** of this report.

4. Potential Traffic Impacts

4.1 Introduction

The following presents an assessment of the potential traffic impacts of the proposal using the Roads and Traffic Authority Guide to Traffic Generating Developments standard approach.

4.2 Development Traffic Generation

Applying the Transport for NSW Technical Direction TDT2013/04a rate to suggests a regional area trip per dwelling rate of 0.78 trips per dwelling in the AM peak hour and 0.71 trips per dwelling in the PM peak.

Therefore, the prosed development of 16 rural residential lots would have the potential to generate **13** trips in the AM peak hour and **12** trips in the PM peak hour.

Overall, the potential traffic generation of the development would be low.

4.3 Trip Distribution

The adopted distribution of trips has been in line with the findings of the Census JTW assessment presented above in Section 2.8 above. To reflect residential living, AM outbound trips are expected to be 80% of the total AM peak generated with 20% inbound trips. The reverse would occur in the PM peak.

The resultant inbound / outbound trips in each peak period are presented below in **Table 10**.

Table 10 – Proposed Development Inbound / Outbound Peak Net Traffic Generation Estimate

Type	AM Peak Hour		PM Peak Hour	
	Inbound	Outbound	Inbound	Outbound
Total Generation	3	10	10	2

4.4 Future Mid-Block Capacity Conditions

The additional traffic generated by the proposed subdivision has been added to the immediate surrounding network in accordance with the adopted distribution of trips presented in Section 2.8 resulting in the following future mid-block capacity conditions.

Table 11 – Future Volume / Capacity Analysis of Roads Surrounding Development Site

Road	Two Way Mid Block Capacity	AM Peak Hour Two Way Flow	AM Peak V/C	PM Peak Hour Two Way Flow	PM Peak V/C
Braidwood Road – South of Garoorigang Street	1,800	242	0.134	296	0.164
Garoorigang Street – West of Braidwood Road	1,800	97	0.054	137	0.076
Hume Street – South of Hume Highway	1,800	111	0.062	213	0.118

From **Table 11** it is noted that upon full development of the proposed sub division, there would be negligible change in the volume capacity ratios on roads immediately surrounding the proposed development.

4.5 Future Intersection Operating Conditions

The additional traffic generated by the proposal has been added to the surrounding road network in accordance with the adopted distribution of trips presented above. The resulting future intersection operating conditions is presented below in **Table 12**.

Table 12 – Future Weekday AM / PM Intersection Operating Conditions

Intersection	Control	Weekday AM Peak		Weekday PM Peak	
		Av Delay	LOS	Av Delay	LOS
Braidwood Rd / Sloane St	Priority	8.7	A	12.5	A
Braidwood Rd / Garoorigang St	Priority	6.2	A	6.3	A
Hume St / Garoorigang St	Roundabout	10.3	A	10.3	A

Avg Delay (sec/veh) is over all movements at signals, and for worst movement at priority and roundabouts

From **Table 12** it is noted that the intersection surveyed in the vicinity of the proposed development would all continue to operate at a satisfactory level of service in the future upon full development of the subject site. Further, there would be no requirement for upgrades at the intersection to accommodate the traffic demands of the proposal.

Overall, the traffic impacts of the proposal are considered acceptable.

SIDRA outputs of all models are provided in **Appendix B** of this report.

4.6 Access Arrangements - Bushfire

As stated above, the majority of lots within the subdivision would include lot (front or rear) frontages to existing roads to the north (Brisbane Grove Road), west (Braidwood Road) and south (Johnsons Lane) where fire truck access would be easily gained to the dwellings. A new internal road would also be provided as an alternative fire truck access to fronting properties.

Whilst the subdivision would be initially isolated, the provision of a further perimeter road along the eastern boundary to separate yet developed residential land (as recommended by the NSW Rural Fire Service Planning for Bushfire Projection Guidelines) appears to be unwarranted.

The proposed design would ensure access to all dwellings for fire vehicles would fully comply with the minimum requirements of the NSW Rural Fire Service Guidelines for Single Residential Development would be achieved within the design. These include:

The following identifies the requirements from PBP 2019 that are required for property access.

Not all access requirements will be applicable to a particular development due to site specific conditions (e.g. some dwelling sites may be located physically close enough to a public road to avoid the need for passing bays). However where compliance with the following requirements is not possible, a performance based solution may be needed.

There are no specific access requirements in an urban area where an unobstructed path (no greater than 70m) is provided between the most distant external part of the proposed dwelling and the nearest part of the public access road (where the road speed limit is not greater than 70kph) that supports the operational use of emergency firefighting vehicles.

5. Conclusions

This report has reviewed the potential traffic impacts of the proposed sixteen (16) lot rural residential subdivision at the known as 2 Brisbane Grove Road, Brisbane Grove. The findings of this assessment are presented below:

1. The potential traffic generation of the development would not impact on the surrounding road network to a point of detriment.
2. Intersections in the immediate vicinity of the development would operate at a satisfactory level of service in the future at full development without any need for capacity improvements.
3. The proposed design would ensure fire vehicle access to properties fully complies with the requirements of the NSW Rural Fire Service Single Dwelling Guidelines.

Overall the traffic impacts of the proposal are considered acceptable.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Give-Way (Two-Way)

Intersection Performance - Hourly Values		
Performance Measure	Vehicles	Persons
Travel Speed (Average)	57.0 km/h	57.0 km/h
Travel Distance (Total)	253.5 veh-km/h	304.2 pers-km/h
Travel Time (Total)	4.4 veh-h/h	5.3 pers-h/h
Desired Speed (Program)	60.0 km/h	
Speed Efficiency	0.95	
Travel Time Index	9.45	
Congestion Coefficient	1.05	
Demand Flows (Total)	251 veh/h	301 pers/h
Percent Heavy Vehicles (Demand)	2.0 %	
Degree of Saturation	0.072	
Practical Spare Capacity	1263.0 %	
Effective Intersection Capacity	3484 veh/h	
Control Delay (Total)	0.16 veh-h/h	0.19 pers-h/h
Control Delay (Average)	2.3 sec	2.3 sec
Control Delay (Worst Lane)	6.1 sec	
Control Delay (Worst Movement)	6.1 sec	6.1 sec
Geometric Delay (Average)	2.2 sec	
Stop-Line Delay (Average)	0.1 sec	
Idling Time (Average)	0.0 sec	
Intersection Level of Service (LOS)	NA	
95% Back of Queue - Vehicles (Worst Lane)	0.1 veh	
95% Back of Queue - Distance (Worst Lane)	0.5 m	
Ave. Queue Storage Ratio (Worst Lane)	0.00	
Total Effective Stops	59 veh/h	71 pers/h
Effective Stop Rate	0.23	0.23
Proportion Queued	0.03	0.03
Performance Index	4.9	4.9
Cost (Total)	188.45 \$/h	188.45 \$/h
Fuel Consumption (Total)	18.4 L/h	
Carbon Dioxide (Total)	43.4 kg/h	
Hydrocarbons (Total)	0.003 kg/h	
Carbon Monoxide (Total)	0.052 kg/h	
NOx (Total)	0.043 kg/h	

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

NA: Intersection LOS for Vehicles is Not Applicable for two-way sign control since the average intersection delay is not a good LOS measure due to zero delays associated with major road movements.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Site Model Variability Index (Iterations 3 to N): 0.0 %

Number of Iterations: 3 (Maximum: 10)

Largest change in Lane Degrees of Saturation for the last three Flow-Capacity Iterations: 38.6% 1.4% 0.0%

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
