1. INTRODUCTION

This report is part of a series of ecological reports prepared for the West Belconnen project for The Riverview Group. The report contains the results of surveys and assessments of the bird fauna in the West Belconnen project area. Studies date from 2008 to 2013. Several key features were targeted in these investigations in response to matters raised by the ACT Department of Environment and Sustainability. Together, these reports form a comprehensive assessment of the biota and the conservation values associated with the project area at West Belconnen. Most reports overlap the NSW-ACT border, as part of the wider project area includes land in the Yass Valley Council area in New South Wales.

2. THE BIRD SURVEYS

Aim: To search for significant bird species, particularly the Superb Parrot and birds of prey, and to augment the bird list for the project area.

The Surveys

The project area has been specifically surveyed for birds on 31 occasions since 2008. The results provide a fairly comprehensive guide to the bird species found in the locality. During these surveys 75 native bird species and nine species of introduced bird were recorded. In all, 50.1 hours of targeted surveys was achieved, involving 3,650 individual bird observations. Most of the 31 surveys were carried out in the spring-summer seasons in 2008 and 2012/13; see **Table 1**. The total number of bird species recorded in the area during all surveys since 2008 is 104, including the nine introduced species.

The amount of survey effort is considered adequate to identify the species that are present in the locality; see species accumulation curve below. A summary of the targeted bird surveys, including date, time, survey areas, method and results are summarised in **Appendix 1**. A complete list of the animal species recorded in the project area is provided in **Appendix 2**, within which those species observed in the ACT and NSW sections of the project area are identified separately.

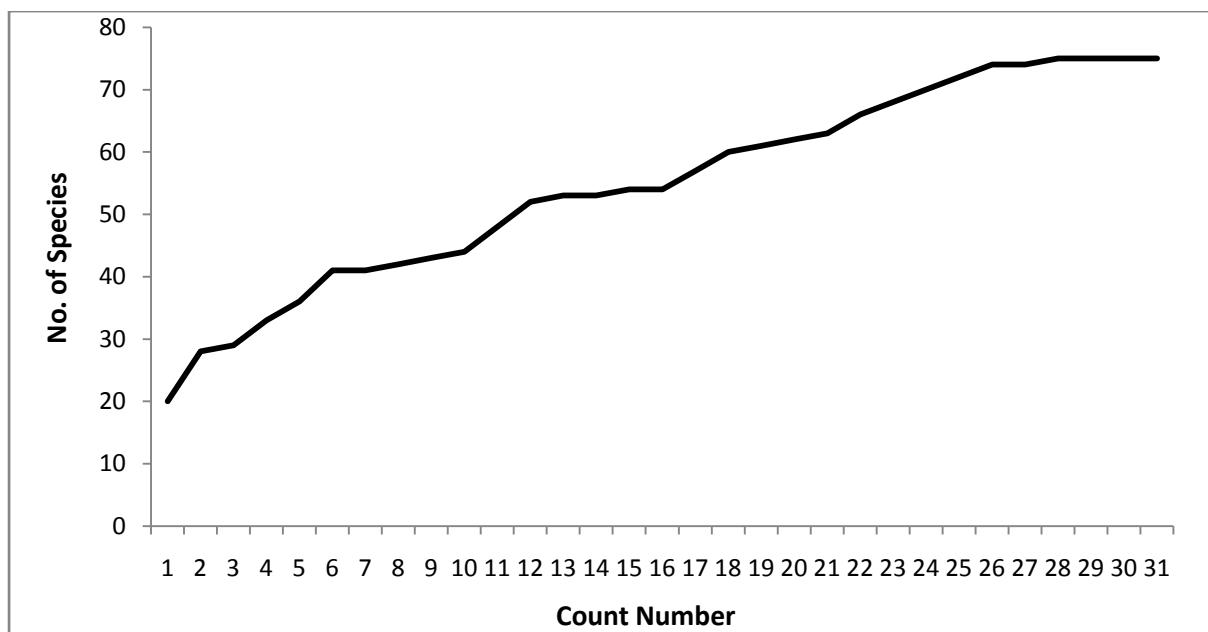

Figure 1. Bird species accumulation curve.

Number of bird surveys

Most surveys were carried out in the spring-summer period in 2008 and 2012/13. Survey sheets from 2012 and 2013 are provided at **Appendix 3**; the sheets from the 2008 surveys are contained in the earlier report by KMA (2009).

Table 1
Season of all Bird Surveys - 2008 to 2013

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2008											2	8
2012									1	11	1	
2013	1	4						1	2			
All	1	4	0	0	0	0	0	1	3	11	3	8

The following figures pertain to each season for all years:

	No. of surveys	Percentage
Spring (Sep Oct Nov)	17	55%
Summer (Dec Jan Feb)	13	42%
Autumn (Mar Apr May)	0	-
Winter (Jun Jul Aug)	1	3%
Total	31	100%

3. SUPERB PARROT SURVEYS

Aim: To determine if the Superb Parrot occurs in the project area and particularly if it is breeding in that area.

The Superb Parrot was seen a few times in the project area; see **Table 2**. Out of a total of 31 bird surveys, this species was observed five times (16%); three records were in late 2012 when the species was regularly observed in the greater West Belconnen area. An observation was made early in the 2013/14 season, when three birds were observed flying over Stockdrill Drive heading south on 2 September 2013.

No evidence of breeding was found during the bird surveys or the tree hollow surveys. Birds were heading south, towards the 2011/2012 breeding area to the south of Holt (Davey 2012). The trees in the south of the area near Stockdrill Drive along with the well treed golf course seem to be a movement corridor for the parrot.

Table 2
Observations of the Superb Parrot

Date	Observation	GPS Location
02 Dec. 2008	1 bird	Overhead at golf course
15 Dec. 2008	1 bird	0681077 6099553
24 Oct. 2012	1m + 2f – heading south	0680733 6099739
24 Oct. 2012	1f – heading south	0681553 6099560
28 Nov. 2012	3 birds - heading north	0680850 6100021
2 Sept. 2013	3 birds - heading south	0680913 6098202

As explained above, the bird surveys were carried out in the most appropriate season for the Superb Parrot (spring-summer), when the species is present in the north-western part of the ACT.

4. SWIFT PARROT ASSESSMENT

Aim: To assess the likelihood of the Swift Parrot occurring in the project area.

The Swift Parrot is a non-breeding winter visitor to the ACT region. Birds only breed in Tasmania in the warmer months and are unpredictable in their occurrence from year to year on the mainland. On the tablelands occurrences are dependent upon flowering eucalypts in the cooler months. The parrot is listed as vulnerable in the ACT under the *Nature Conservation Act 1980*.

In the early 1990s in the ACT it was reported that a few birds turn up every two or three years between April and September (Taylor 1992). Records up to 1992 came from the central Canberra area (COG 1990; Taylor 1992). The sporadic records from the ACT are typical of the species on the mainland, where their presence in any particular area is inconsistent and unpredictable.

The Swift Parrot could turn up anywhere in the ACT where there are flowering trees, particularly Yellow Box *Eucalyptus melliodora* and Blakely's Red Gum *E. blakelyi*. The trees in the West Belconnen project area could attract the Swift Parrot in some years, but this is not regular and birds are just as likely to turn up in the nearby suburbs. Breeding obviously would not occur in the area. The most important features in the project area for this species are the old eucalypts.

5. OTHER SIGNIFICANT BIRDS

Aim: To identify significant bird species in the project area, particularly those listed under the ACT Nature Conservation Act 1980 and NSW Threatened Species Conservation Act 1995.

In addition to the Superb Parrot, several other bird species of conservation interest were located in the project area over the 2008-2013 survey periods; see **Table 3**. These records were associated with treed areas, including the exotic trees around the homestead west of the waste disposal area. One species, the White-winged Triller, is listed as threatened in the ACT, while six other species are listed in NSW and two species is of conservation concern in both jurisdictions but are not listed in either.

6. BIRDS OF PREY

Aim: To identify the birds of prey occurring in the project area and to determine if breeding is occurring there.

Diurnal birds of prey were specifically targeted during all bird surveys and at other times while on site; to date 11 species have been recorded; see **Table 4**. The following records were made in the project area from 2008 to 2013. All records with observation dates are provided at **Appendix 5**. The only breeding species found is the Nankeen Kestrel, which is by far the most common bird of prey in the area. The Kestrel is also probably the only resident species within the upper, eastern part of the project area, although some species may be resident within the river gorge. There is a known Peregrine Falcon nesting area on cliffs in the river gorge, outside the main project area.

7. TREE HOLLOW SURVEY

The surveys, carried out in October-November 2012, involved visiting almost all of the trees on the gentler topography in the project area; in all 246 trees were surveyed. Each tree, dead or alive, was inspected for obvious hollows. If hollows were present, the following information was recorded.

- a unique number and tree species;
- dch, trunk diameter at chest height, a measure of tree size;
- location as given by GPS instrument;
- the number of obvious hollows present;
- observed use by animals, native and exotic;
- the tree number was written against the tree on a colour aerial photograph.

A summary of all hollow-bearing trees recorded in the project area is provided in **Table 5**; the hollow-bearing trees recorded are listed individually in **Appendix 4**.

Sixty-nine observations of thirteen animal species were made of individuals utilising tree hollows in the project area; this involved 10 native species and three introduced species (see **Table 6**). No rare or threatened species were amongst the species recorded using tree hollows.

8. OTHER MATTERS

The opportunity is taken here to provide a complete plant species list for the project area; this is not comprehensive for the river valley as most of that area was not searched intensively. The list at **Appendix 6** combines lists from all previous relevant studies as listed earlier in this report.
