VPH	Vehicles per Hour

# 1. INTRODUCTION

PSA Consulting has been engaged by Planit Consulting to provide traffic engineering advice and prepare a Traffic Impact Assessment (TIA) to accompany the Planning Proposal to amend the Tweed Local Environmental Plan (LEP) 2014, seeking to change the zoning from Primary Production to an urban zone. The development includes the construction of the proposed Cudgen Connection Health Precinct, located on land at 741 Cudgen Road, Cudgen (formally described as Lot 6 DP727425). The site is located within the Tweed Shire Council (TSC) Local Government Area.

The site is located in central Cudgen on Cudgen Road, as shown in Figure 1.

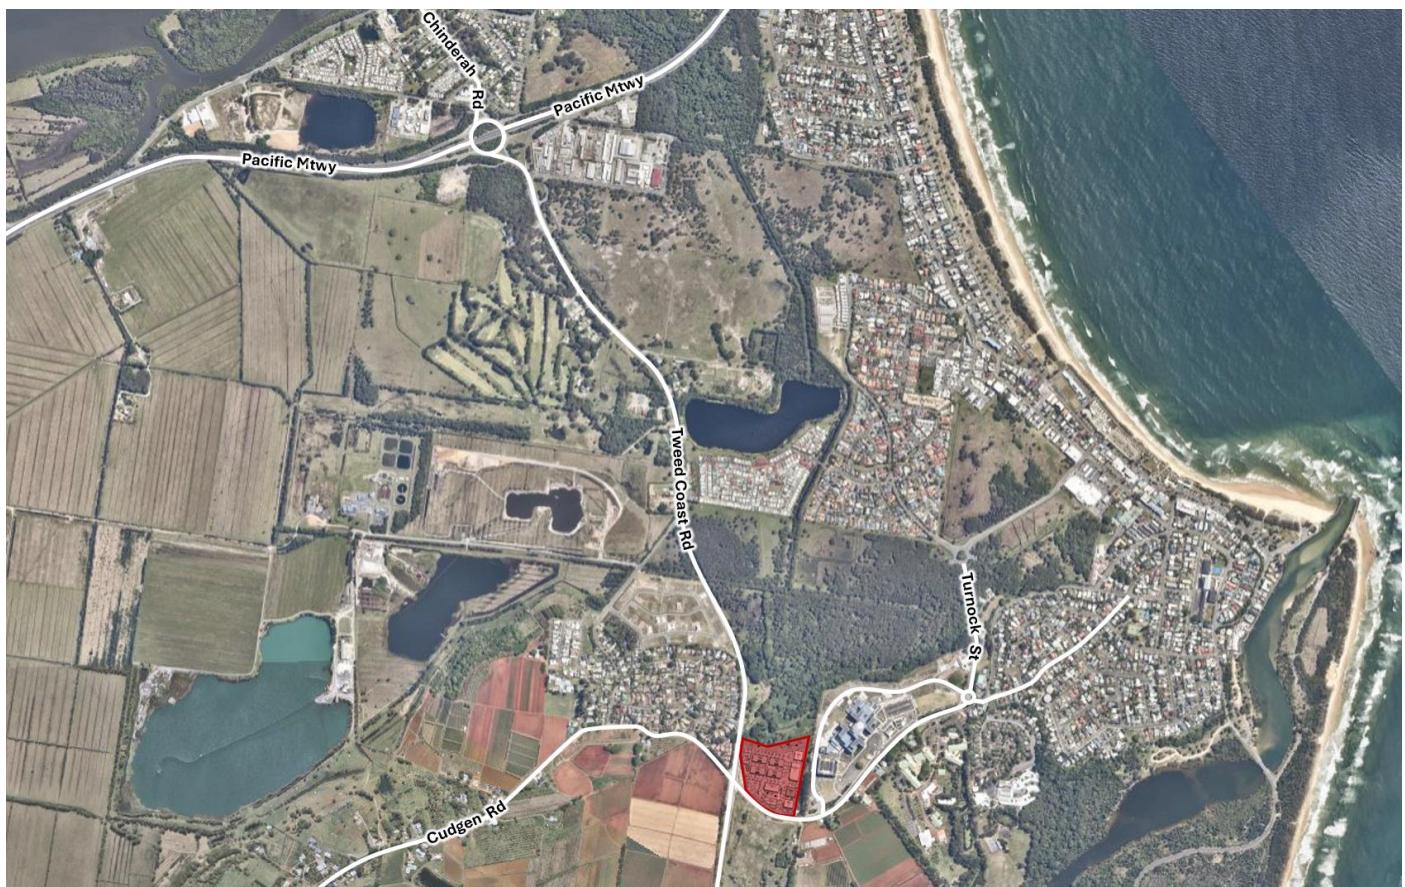

Figure 1: Site Locality Plan (Source: Nearmap)

## 1.1 PREVIOUS ASSESSMENT AND CONSULTATION

A transport assessment report has previously been prepared by Ason Group in February 2021 as part of Due Diligence investigations into the development of the site. This report was provided as part of material submitted in advance of a pre-lodgement meeting with Tweed Shire Council and Transport for NSW held on 24 March 2022. Analysis undertaken as part of this assessment has considered comments provided in the pre-lodgement meeting.

A Traffic Impact Assessment was undertaken for the site in 2023 by PSA Consulting, which was based on the previous and planned intersection upgrade at Tweed Coast Road / Cudgen Road. The land use proposal had also changed in comparison to the Ason Group analysis, namely through a stronger focus on essential worker housing and mental health provision. The intention of the additional housing delivery is to prioritise accommodation for essential workers within the health and knowledge precinct (Cudgen Connection Health Precinct, Tweed Valley Hospital and NSW TAFE site).

This updated TIA has been prepared to address the panel recommendations from Rezoning Review determined on 17 September 2024. The TIA utilises traffic volumes from the intersection upgraded in 2023 as a result of the new Tweed Valley Hospital. Table 1 outlines the panel's recommendations and the corresponding sections of the report where each has been addressed.

**Table 1: Panel's Recommendation (Source: NSW Government, PSA)**

PANEL'S RECOMMENDATION	SECTION
• Estimated site traffic trip generation calculations utilised	4.2
• Further information or discussion clarifying estimates to calculate proposed private and mental health hospitals traffic generation	4.2
• Further clarification and/or justification on the use of estimated 30% development trip generation reduction	4.2.1
• Modelling of the proposed new signalised intersection	5.4
• Access of Tweed Coast Road and how it will tie in with Cudgen Road	5.4.4

## 2. EXISTING CONDITIONS

### 2.1 EXISTING SITE

The site covers approximately 5.7 hectares and currently contains a single freehold dwelling. The site is zoned as RU1 Primary Production as per the TSC LEP 2014, indicating that the zone is to encourage sustainable industry production by maintaining and enhancing the natural resource base. The site is bounded by Tweed Coast Road to the West, Cudgen Road to the South, vacant land to north, and the currently under construction Tweed Valley Hospital to the east.

### 2.2 ROAD NETWORK

The proposed development is located on the corner of Cudgen Road and Tweed Coast Road, shown in Figure 2.

**Figure 2: Surrounding Road Network (Source: Nearmap, Transport for NSW)**

The Tweed Coast Road / Cudgen Road intersection has been upgraded as part of the Tweed Coast Road four-lane upgrade including recommendations from the TIA for Stage 2 of the Tweed Valley Hospital (TVH) prepared by Bitzios Consulting in 2019.

A description of each of the surrounding roads is as follows in Sections 2.2.1 to 2.2.4.

#### 2.2.1 Tweed Coast Road

Tweed Coast Road is a council-controlled single carriageway road which extends from the Pacific Motorway in the north to the town of Wooyung in the south, running adjacent to the proposed site. Tweed Coast Road provides access to the majority of towns on the Tweed Coast. In the vicinity of the site, Tweed Coast Road is an undivided, two-lane, two-way road with a posted speed limit of 60km/h. As per Transport for NSW (TfNSW) Road Network Classifications, Tweed Coast Road is listed as a regional road in the site vicinity.

## 2.2.2 Cudgen Road

Cudgen Road is a council-controlled single carriageway local street which runs in an east-west direction to the south of the site. The road stretches from Tweed Valley Way in the West to Quigan Street in the east, crossing Tweed Coast Road at a signalised intersection adjacent to the proposed site. In the vicinity of the site, Cudgen Road is an undivided, two lane, two-way road with a posted speed limit of 60km/h.

## 2.2.3 Pacific Motorway

The Pacific Motorway is a state-controlled major road, running from Brisbane to Brunswick Heads where it connects to the Pacific Highway. In the vicinity of Cudgen and Tweed Coast Road, the Pacific Motorway is a four lane, two-way median divided road, with a posted speed limit of 110km/h.

## 2.2.4 Turnock Street

Turnock Street is a council-controlled single carriageway local street which runs in a southwest-northeast direction to the east of the site. The road stretches from the roundabout with Cudgen Road to Marine Parade to the east. In the vicinity of the site, Turnock Street is an undivided, two-lane, two-way road with a posted speed limit of 60km/h.

## 2.3 EXISTING ACTIVE TRANSPORT NETWORK

There are existing shared paths for pedestrians and cyclists on the northern side of Cudgen Road in the vicinity of the site, with formal pedestrian crossing facilities at the Tweed Coast Road / Cudgen Road and Cudgen Road / Tweed Valley Hospital Access signalised intersections. The existing active transport network and facilities surrounding the development site are illustrated in Figure 3.

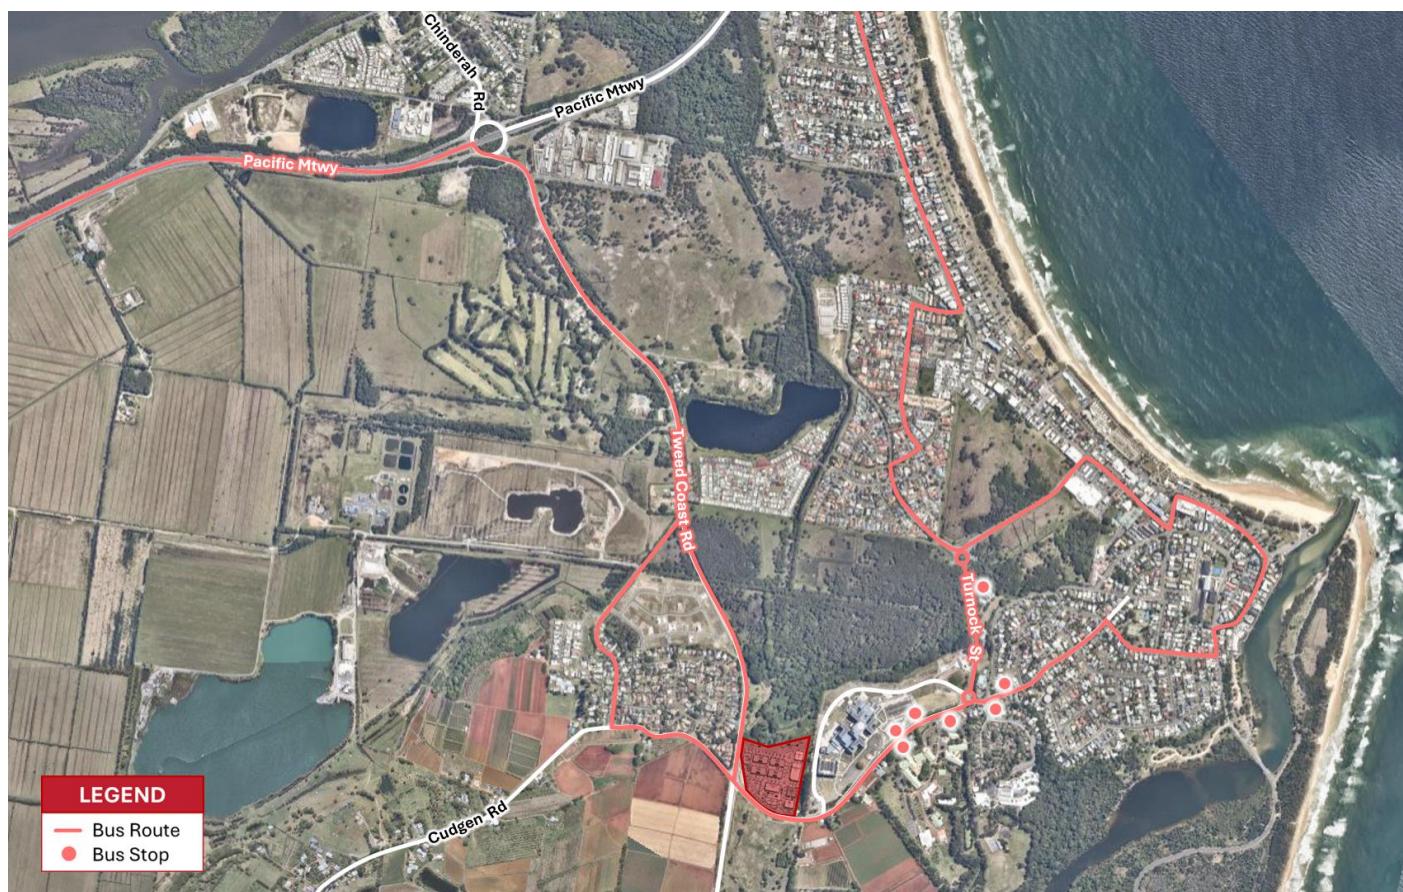

Figure 3: Surrounding Active Transport Network (Source: Nearmap)

## 2.4 EXISTING PUBLIC TRANSPORT NETWORK

There are a number of TfNSW bus stops in the vicinity of the development site, shown in Figure 4, with the closest stop being located approximately 300m to the west of the site within walking distance.

**Figure 4: Surrounding Public Transport Network (Source: Nearmap, Transport for NSW)**

Details of bus routes which service these stops are as follows:

**Table 2: Existing Public Transport Schedule (Source: Transport for NSW)**

ROUTE CODE	ROUTE	FREQUENCY	
		Weekday	Weekend
601	Tweed Valley Hospital to Tweed Mall via Kingscliff	30 mins	30 mins
603	Pottsville to Tweed City via Hastings Point, Cabarita Beach, Tweed Valley Hospital & Chinderah	1 hr	1 hr
609	Murwillumbah to Tweed Valley Hospital & Kingscliff TAFE	2 hrs	-

The existing public transport network, therefore, provides good connections to local destinations in Northern NSW. However, the current limited frequency of the services is not overly conducive to converting a significant number of private vehicle trips to public transport.

## 2.5 BACKGROUND TRAFFIC VOLUMES

Existing traffic volumes were taken from the TIA prepared for the Tweed Valley Hospital Project Stage 2 by Bitzios in 2019. These counts were conducted by Traffic Data and Control (TDC) in May 2018, and included the following major intersections in the vicinity of the proposed development:

1. Pacific Motorway / Tweed Coast Road
2. Tweed Coast Road / Cudgen Road
3. Cudgen Road / Turnock Street.

Updated traffic counts were undertaken at Tweed Coast Road / Cudgen Road intersection on Tuesday 15 October 2024 during AM and PM peak periods due to the recent upgrade as a result of the new Hospital. The summary of traffic counts is provided in Appendix 1.

The background traffic volumes of surrounding intersections for the current (2024) year have been calculated as follows:

- Background traffic growth rate on Tweed Coast Road has been applied as 0.80% per annum compounded, and 1.73% per annum compounded for the Cudgen Road / Turnock Street corridor and turning movements at the Tweed Coast Road / Cudgen Road intersection, as per the Stage 2 TIA prepared for the neighbouring Tweed Valley Hospital by Bitzios in 2019. This growth was calculated from 2018 traffic counts and 2041 Base ‘no infrastructure upgrades’ strategic model daily volumes (as per 2017 Tweed Road Development Strategy report).
- Projected 2024 background traffic has been calibrated based on the 2024 traffic counts at Tweed Coast Road / Cudgen Road.
- The expected development traffic from the Tweed Valley Hospital (TVH) to the east of the proposed development from the Bitzios report has been also included in the background traffic volumes. It has been assumed that the TVH is currently operating with 327 beds and is expected to increase its capacity to 430 beds by 2032.
- The trip directionality for the generated trips has been calculated based on the 2024 traffic survey.

The background turning movement is provided in Appendix 2.

## 3. STRATEGIC ASSESSMENT OF FUTURE NETWORK

This section presents the assessment of the Cudgen Connection proposal against state and local government strategies and objectives, outlined in Table 3.

**Table 3: Assessment Against Strategic Documents**

STRATEGY/OBJECTIVE	REMARKS
<p>North Coast Regional Plan 2041, Strategy 15</p> <p><b>Strategy 15.1</b></p> <p>Protect proposed and existing transport infrastructure and corridors to ensure network opportunities are not sterilised by incompatible land uses or land fragmentation.</p> 	<p>Future capacity of transport network has not been assessed in detail due to the various unknown timing of several factors, including the future network scenarios and infrastructure proposed through the TRDS, growth in local area, staging of the future development, staging of the TVH, Kings Forest development staging/timeframes etc. (Refer to Section 4.2 for more details).</p> <p>The planned infrastructure upgrades outlined in 2017 TRDS are expected to significantly ease the demand at Cudgen Road and turning movements to/from Tweed Coast Road at Tweed Coast Road / Cudgen Road intersection.</p> <p>An uptake in the AT/PT mode share is also expected due to planned improvements in AT/PT infrastructure/facilities through the TVH and Cudgen Connection developments, which would reduce car travel demand.</p>
<p><b>Collaboration Activity 4</b></p> <p>To ensure that centres experiencing high growth have well planned and sustainable transport options, place-based Transport Plans will be developed for key cities and centres across the North Coast region.</p> <p><b>Lead Agency:</b> Transport for NSW</p> 	
<p><b>Collaboration Activity 5</b></p> <p>In collaboration with Tweed Shire Council, City of Gold Coast and Department of Transport and Main Roads Queensland develop opportunities for multimodal transport connections to Coolangatta and the Tweed.</p> <p><b>Lead Agency:</b> Transport for NSW</p> 	

## North Coast Regional Plan 2041, Strategy 16

### Strategy 16.1

Encourage active and public transport use by:

- prioritising pedestrian amenity within centres for short everyday trips
- providing a legible, connected and accessible network of pedestrian and cycling facilities
- delivering accessible transit stops and increasing convenience at interchanges to serve an ageing customer
- incorporating emerging anchors and commuting catchments in bus contract renewals
- ensuring new buildings and development include end of trip facilities
- integrating the active transport network with public transport facilities
- prioritising increased infill housing in appropriate locations to support local walkability and the feasibility of public transport stops.

### Strategy 16.2

Local plans should encourage the integration of land use and transport and provide for environments that are highly accessible and conducive to walking, cycling and the use of public transport and encourage active travel infrastructure around key trip generators.

### Strategy 16.1

It is proposed that active and public transport will be encouraged through the following means:

- Provision of essential worker accommodation, which would prioritise short trips by walking between the proposed development and the TVH.
- Provision of a network of pedestrian and cycling facilities internal to the site and connecting to both the external networks and the adjacent TVH
- Liaison with TfNSW to investigate the opportunity to provide a passenger transport facility internal to the site. Should this not be possible, pedestrian pathways will be provided to the facilities on Cudgen Road external to the TVH.
- Provision of end of trip facilities for all uses

### Strategy 16.2

- Co-location of proposed land uses with the TVH encourages accessibility and is conducive to walking and cycling.
- The proposal integrates a variety of land uses and hours of operation to support stronger dependence within the precinct and ultimately facilitate a greater proportion of multi-purpose trips. The proposal incorporates the provision of additional active and public transport infrastructure to improve accessibility, mobility and promote AT/PT travel modes. The Concept Masterplan seeks to cluster land uses with direct synergies to maximise walking and cycling within the precinct, and the increased self-reliance is expected to substantially reduce travel movements outside the precinct, such as for specialist appointments and tests, food, drink and general retailing needed by precinct users and workers. In turn, this will mitigate traffic and carparking impacts on the Kingscliff Town Centre, as well as reduce total travel time for health and education users.

## Urban Growth Area Variation Principles

Urban Growth Area Variation Principles	
Policy	The variation needs to be consistent with the objectives and outcomes in the <i>North Coast Regional Plan 2041</i> and should consider the intent of any applicable Section 9.1 Direction, State Environmental Planning Policy and local growth management strategy.
Infrastructure	The variation needs to consider the use of committed and planned major transport, water and sewerage infrastructure, and have no cost to government. The variation should only be permitted if adequate and cost effective infrastructure can be provided to match the expected population.

The future transport demands are expected to be accommodated through a number of planned infrastructure upgrades in the area, as per 2017 TRDS:

- Four-lane upgrade of Tweed Coast Road between the Pacific Highway and Casuarina;
- A new east-west connection associated with the northern component of the Gales Kingscliff development linking Tweed Coast Road to Kingscliff Street;
- The north-south extension of Elrond Drive associated with the northern component of Gales Kingscliff, allowing for a connection of Beach Street through to Ozone Street;
- A new east-west connection associated with the southern component of the Gales Kingscliff development extending Turnock Street to Tweed Coast Road linking Tweed Coast to Kingscliff Street;
- Reconfiguration of the Morton Street intersection from Tweed Coast Road and improvements for access for Chinderah Industrial Estate;
- Improvements to the Pacific Highway / Tweed Coast interchange in consultation with RMS.

## Ministerial Direction, Focus Area 5: Transport and Infrastructure

### **Focus area 5: Transport and Infrastructure**

#### 5.1 Integrating Land Use and Transport

##### **Objectives**

The objective of this direction is to ensure that urban structures, building forms, land use locations, development designs, subdivision and street layouts achieve the following planning objectives:

- (a) improving access to housing, jobs and services by walking, cycling and public transport, and
- (b) increasing the choice of available transport and reducing dependence on cars, and
- (c) reducing travel demand including the number of trips generated by development and the distances travelled, especially by car, and
- (d) supporting the efficient and viable operation of public transport services, and
- (e) providing for the efficient movement of freight.

##### **Application**

This direction applies to all relevant planning authorities when preparing a planning proposal that will create, alter or remove a zone or a provision relating to urban land, including land zoned for residential, employment, village or tourist purposes.

The proposal supports provision of transport choice aligning with the principles of *Improving Transport Choice – Guidelines for planning and development (DUAP 2001)* and *The Right Place for Business and Services – Planning Policy (DUAP 2001)* through the following:

- Co-location of proposed land uses with the TVH encourages accessibility and is conducive to walking and cycling.
- The proposal integrates a variety of land uses and hours of operation to support stronger dependence within the precinct and ultimately facilitate a greater proportion of multi-purpose trips.
- The proposal incorporates the provision of additional active and public transport infrastructure to improve accessibility, mobility and promote AT/PT travel modes.
- The Concept Masterplan seeks to cluster land uses with direct synergies to maximise walking and cycling within the precinct, and the increased self-reliance is expected to substantially reduce travel movements outside the precinct, such as for specialist appointments and tests, food, drink and general retailing needed by precinct users and workers. In turn, this will mitigate traffic and carparking impacts

### Direction 5.1

- (1) A planning proposal must locate zones for urban purposes and include provisions that give effect to and are consistent with the aims, objectives and principles of:
- Improving Transport Choice – Guidelines for planning and development* (DUAP 2001), and
  - The Right Place for Business and Services – Planning Policy* (DUAP 2001).

### Consistency

A planning proposal may be inconsistent with the terms of this direction only if the relevant planning authority can satisfy the Planning Secretary (or an officer of the Department nominated by the Secretary) that the provisions of the planning proposal that are inconsistent are:

- justified by a strategy approved by the Planning Secretary which:
  - gives consideration to the objective of this direction, and
  - identifies the land which is the subject of the planning proposal (if the planning proposal relates to a particular site or sites), or
- justified by a study prepared in support of the planning proposal which gives consideration to the objective of this direction, or
- in accordance with the relevant Regional Strategy, Regional Plan or District Plan prepared by the Department of Planning and Environment which gives consideration to the objective of this direction, or
- of minor significance.

Date commenced: 20 February 2023

Local Environmental Plan Making Guideline, August 2023

#	Question	Considerations
<b>Section D – Infrastructure (Local, State and Commonwealth)</b>		
11	<b>Is there adequate public infrastructure for the planning proposal?</b>	<ul style="list-style-type: none"><li>• Generally, this applies where the planning proposal includes development that will, or is likely to, require the provision of, or increase the demand for, public facilities and services</li><li>• Address whether existing infrastructure is adequate to serve or meet the needs of the proposal and how any predicted shortfall in infrastructure provision could be met</li><li>• Undertake studies required to identify the extent of any infrastructure shortfall, potential mechanisms or strategies to address any shortfall and which agencies have been consulted as part of that process</li><li>• The proponent/PPA is to identify what local and regional infrastructure may be needed</li></ul>

on the Kingscliff Town Centre, as well as reduce total travel time for health and education users.

2017 TRDS recommended two east-west links between Tweed Coast Road and Turnock Street / Kingscliff Street. The introduction of these planned links is expected to significantly ease the demand on Cudgen Road and turning movements to/from Tweed Coast Road at Tweed Coast Road / Cudgen Road intersection. In addition, advancing the proposed rezoning provides additional movement corridors, and specifically

provides opportunities and priority for emergency vehicles. However, there is significant uncertainty in both the future demand and planned infrastructure including the below, which have made quantification of the assessment unfeasible at this time:

- the timeframe proposed for the planned infrastructure upgrades by Council;
- the quantum of traffic reduction at Tweed Coast Road / Cudgen Road intersection; and
- the potential change in mode share for the Hospital, this proposed development and the broader community in future as a result of increased PT services (including frequency and route coverage) and infrastructure and any changes and increases

- For planning proposals likely to place additional demands on public infrastructure, it is important to undertake consultation with the public authorities and government agencies responsible for the provision of that infrastructure. The Gateway determination will confirm whether a local contributions plan is required to be exhibited with the planning proposal and require regular feedback on the progress of finalizing an infrastructure strategy and high-level costs
- For planning proposals, a local contributions plan may be required. Liaison with the council is necessary

in congestions across the shire which would improve the contestability of PT against private vehicle trips.

There is also the potential for additional infrastructure upgrades at the site frontage including widening Cudgen Road and / or acquiring land on the north-eastern corner of the Tweed Coast Road / Cudgen Road intersection. As outlined above, due to the variety of uncertainty regarding the timing of planned infrastructure and the background traffic demand, the quantification of the benefits of these potential infrastructure improvements are as yet unable to be determined.

Notwithstanding, it is evident that additional capacity, well beyond that projected by this rezoning, will be realised within the transport network as a result of the planned infrastructure upgrades.

Finally, in order to encourage people to use PT and Active Travel, investment into PT and AT infrastructure and services are necessary across the region, rather than relying on private vehicle trips which require unsustainable continual infrastructure upgrades at intersections and road links, in contrast to Australia's long-term emissions reduction plan.

The proponent will continue to work with key stakeholders to coordinate development and infrastructure delivery through future stages, such as the preparation and assessment of Development Applications. This is anticipated to include unlocking developer contributions to accelerate infrastructure funding, as well as pursuing localised upgrades where appropriate and necessary for capacity improvements.

## 4. DEVELOPMENT PROFILE

The site for this study is located on the corner of Cudgen Road and Tweed Coast Road. The site comprises a section of Lot 6 on DP727425 (741 Cudgen Road, Cudgen) as per the Tweed Local Environmental Plan 2014. The existing site currently contains a single freehold dwelling. For the purposes of this assessment, any existing traffic generated by this dwelling was considered to be negligible.

### 4.1 DEVELOPMENT DETAILS

At this stage of planning, the exact details of the development are still being considered and will be informed by the outcomes of various technical assessment currently being completed. The proposed development is indicatively intended to consist of the following elements:

- Five (5) essential worker accommodation buildings (286 units in total)
- Residential Recreation Space
- Mental Health Hospital
- Private Hospital and Medical Suites
- University Campus
- Medical Hotel
- Retail and Community Centre
- Childcare Centre
- Plaza

Figure 5 shows the proposed development masterplan, with the full site plan included in Appendix 3.

Figure 5: Proposed Development Masterplan (Source: Cottee Parker Architects)

The access arrangements for the proposed site will be evaluated in the following sections to identify the option that minimizes the impact on the Tweed Coast Road / Cudgen Road intersection. The site will be designed to ensure low on-site speed operation with narrow cross-sections and horizontal local area traffic management. Further, all internal intersections being slow-speed roundabouts should make it an unattractive rat-run. The potential future connection with TVH is subject to discussions and agreement from the Northern NSW Local Health District and proposed to be restricted to emergency vehicles and potentially buses only. However, as indicated within the previous TIA, the road network will exceed performance threshold even at base case. To allow access arrangement options to be viable, it has been assumed that traffic coming from Turnock Street and Cudgen Road from the east will utilise the Tweed Valley Hospital access at the Cudgen Road / Turnock Street roundabout to alleviate right turning movement to the access point/s.

Consideration has been given to providing sufficient active and public transport connectivity both within and to the development site. This includes a dedicated pedestrian connection between Cudgen Connection and the Tweed Valley Hospital. Pedestrian access to the site will be able to be gained at the proposed access point/s.

Based on the indicative site masterplan, the development yields of each land use for the proposed development are shown in Table 4.

**Table 4: Total Area by Use (Source: Centuria Healthcare)**

LAND USE	SITE YIELD (GFA)
Residential (286 units)	24,061 m <sup>2</sup>
Health	22,750 m <sup>2</sup>
Services	7,100 m <sup>2</sup>
Education	7,000 m <sup>2</sup>
Retail	1,600 m <sup>2</sup>

The development yields for each land use type are presented in Table 5.

**Table 5: Development Yields (Source: Centuria Healthcare)**

LAND USE	SITE YIELD (GFA)
Worker Units	24,061 m <sup>2</sup> (286 units)
Private Hospital	9,000 m <sup>2</sup>
Medical Suites	6,750 m <sup>2</sup>
Mental Health Hospital	7,000 m <sup>2</sup>
University Campus	7,000 m <sup>2</sup> (640 students)
Medical Hotel	5,000 m <sup>2</sup> (100 units)
Retail	1,600 m <sup>2</sup>
Community Centre	1,000 m <sup>2</sup>
Childcare	1,100 m <sup>2</sup>
Residential Recreation Space*	260 m <sup>2</sup>
Plaza*	1,900 m <sup>2</sup>

\* It was assumed this will not generate trips on its own.

This is the overarching plan for the site, which, if necessary, will be staged to respond to any infrastructure capacity limitations throughout time. The proponent will work with key stakeholders through future investigations to support the coordination of development and delivery of network upgrades.

## 4.2 TRIP GENERATION

The estimated site traffic has been calculated for the proposed health precinct development. The trip generation rates for this assessment have been obtained from a variety of sources, including:

- NSW Roads and Traffic Authority (RTA) Guide to Traffic Generating Developments, 2002
- Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition, 2020

The trip generation rates for the different land uses are shown in Table 6.

**Table 6: Trip Generation Rates (Source: RTA, ITE)**

LAND USE	AM PEAK HOUR RATE	PM PEAK HOUR RATE	REFERENCE
High Density Residential	0.29 per unit	0.29 per unit	RTA
Hospital	0.93 per 100 m <sup>2</sup>	1.05 per 100 m <sup>2</sup>	ITE
Medical Centre	10.4 per 100 m <sup>2</sup>	8.8 per 100 m <sup>2</sup>	RTA
Office	2 per 100 m <sup>2</sup>	2 per 100 m <sup>2</sup>	RTA
University/College	0.14 per student	0.15 per student	ITE
Motel	0.4 per unit	0.4 per unit	RTA
Supermarket	7.30 per 100 m <sup>2</sup>	9.89 per 100 m <sup>2</sup>	ITE
Recreational Community Centre	1.99 per 100 m <sup>2</sup>	2.72 per 100 m <sup>2</sup>	ITE
Childcare	12.63 per 100 m <sup>2</sup>	12.72 per 100 m <sup>2</sup>	ITE

Based on the trip generation rates for each land use, the overall estimated trip generation for the proposed development is outlined in Table 7.

**Table 7: Development Trip Generation (Source: PSA)**

DEVELOPMENT	LAND USE	YIELD	AM PEAK HOUR		PM PEAK HOUR	
			Peak Hour Rate	Peak Hour Trip	Peak Hour Rate	Peak Hour Trip
Worker Units	High Density Residential	286 units	0.29 per unit	83	0.29 per unit	83

<b>Total</b>				<b>856 trips</b>		<b>902 trips</b>

#### 4.2.1 Development Trip Generation Reduction

The trip generation reported in Table 7 assumes there is no trip-chaining or co-use of the various land uses of the development. In reality, it is considered that there will be a factor of reduced trip generation given the complimentary uses. A number of reduction factors could be applied to different proposed land uses, including:

- Reduction to worker units' trips based on the assumption that workers are employed at either Cudgen Connection or Tweed Valley Hospital. A reduction is only partial for this use, however, as trips could be generated by their family members, or driving children to/from school etc. The reduction assumed for this is considered conservative at approximately a 30% reduction to account for these family member trips.
- Reduction to private hospital /mental hospital / medical suites trips (assumed that workers will live on-site in the worker units). Further to this, a direct relationship between hospital staff and those working within the medical suites is present. The reduction assumed for this is considered conservative at approximately a 40% reduction to account for additional trips that may be undertaken during peak periods for staff that do not reside in the workers units and for visitors to the facilities.
- Reduction to childcare trips (assumed that the spaces at the childcare will be limited to workers employed at either Cudgen Connection or the Tweed Valley Hospital). The proponent is willing to be conditioned to include a management requirement to control this. The reduction assumed for this is considered conservative at approximately a 45% reduction. This conservative reduction is to allow for generation of the centre by external childcare facility staff (unlikely to be generating high demand during peak periods) and any families that make onward trips from the centre.
- Reduction to retail and community centre trips (assumed these are mostly used by those working, studying and living on-site). The reduction assumed for this is considered conservative at approximately a 50% reduction. The retail trips are likely to be generated by internal developments and those at the nearby Tweed Valley Hospital rather than being considered a destination for trips independent of the medical facilities on the site.

Similarly, reductions could be applied to TVH trips, assuming that workers will live in the worker units and use childcare and other services in the proposed precinct.

The total trip reduction for the proposed development due to the factors listed above is anticipated to be around 30%. This will be considered and demonstrated in detail at the DA stage.

Further reduction in car trips is expected due to planned improvements in Public Transport (PT) and Active Transport (AT) infrastructure / facilities for both Cudgen Connection and TVH developments. The reliable predictions for the uplift in the PT/AT mode share are not possible at this stage, partly due to the lack of finalisation of Public Transport service provision to the site. TfNSW's Regional NSW Services and Infrastructure Plan suggests the following targets: PT mode share 3-5%; walking mode share 4-8%; and cycling mode share: 2-5%. It is suggested that these targets at a minimum be applied and planned for to ensure that overall, the targets for the Kingscliff region are met. The addition of bus stops and new routes with the construction of Tweed Valley Road is expected to boost public transport usage, providing an opportunity for the region to increase its overall public transport mode share.

It is recommended that a Green Travel Plan be conditioned to be completed for future stages of assessment of the development, which will outline the proposed development's plan for reductions in single-occupancy car trips and promotion of alternative options such as walking and cycling for shorter trips and public transport or carpooling for longer trips. As per the Local Environmental Plan Making Guideline, specifically Attachment C, the preparation of a Green Travel Plan is not necessary or appropriate at this time. The timing of a Green Travel Plan with a future DA/s is confirmed as appropriate by the industry-specific Planning Secretary's Environmental Assessment Requirements for hospitals and other state significant development types.

## 5. INTERSECTION ASSESSMENT

### 5.1 KEY PERFORMANCE PARAMETERS

Key measures of performance are generally used when assessing the operations of intersections. These include:

- Level of Service (LoS);
- Degree of Saturation (DoS) and practical capacity; and
- Queue Length for critical movements.

Allowable thresholds used for this study are defined in the following sections. These thresholds are based on standard practice adopted within New South Wales and form the basis of the determination of any deficiencies within the existing or future road network.

#### 5.1.1 Level of Service

The definitions of Levels of Service and delay, as outlined in SIDRA intersection are shown in Table 8. These values are also included in Austroads' Guide to Traffic management Part 3: Transport Study and Analysis Method and acknowledge the extensive use of SIDRA method in the industry practice.

**Table 8: Level of Service (Source: SIDRA)**

LEVEL OF SERVICE	SIGNALISED INTERSECTION	ROUNDABOUT	UNSIGNALISED INTERSECTION
A	$d \leq 10$	$d \leq 10$	$d \leq 10$
B	$10 < d \leq 20$	$10 < d \leq 20$	$10 < d \leq 15$
C	$20 < d \leq 35$	$20 < d \leq 35$	$20 < d \leq 25$
D	$35 < d \leq 55$	$35 < d \leq 50$	$25 < d \leq 35$
E	$55 < d \leq 80$	$50 < d \leq 70$	$35 < d \leq 50$
F	$80 < d$	$70 < d$	$50 < d$

#### 5.1.2 Degree of Saturation

The effect of differing levels of traffic flow on the operating performance of intersections has traditionally been assessed by dividing the intersection volume with its capacity – referred to as the Degree of Saturation (DOS). As traffic volumes approach the capacity of the intersection, the DOS approaches the theoretical capacity of 1. The practical DOS thresholds used for assessment are presented in Table 9, which are industry standard across jurisdictions.

**Table 9: Practical Degree of Saturation at Intersections (Source: Austroads)**

INTERSECTION TYPE	PRACTICAL DOS
Sign Controlled	0.80
Roundabout	0.85
Signalised	0.90

#### 5.1.3 Queue Lengths

The SIDRA queue lengths reported herein are 95th percentile queues. This means that 95% of the time, queue lengths will not exceed the specified queue length. Queue lengths are deemed acceptable if queuing is contained within given storage areas. Where queuing exceeds the short lane capacity, queue lengths can also be deemed acceptable provided that queues do not impact upon major adjacent conflict points (e.g. an adjacent through lane).

## 5.2 TRAFFIC ASSESSMENT SCENARIOS

For this assessment, key intersections have been analysed in the following 3 scenarios:

- 2024 base case background traffic
- 2026 opening year background traffic
- 2026 opening year design traffic
- 2036 10-year horizon background traffic
- 2036 10-year horizon design traffic

It has been assumed that the proposed development is connected with the adjacent Tweed Valley Hospital and trips coming to/from the east will enter through Cudgen Road / Turnock Road roundabout. Signal timing for the options scenarios has been modelled using practical cycle time to determine optimal cycle time, particularly when hospital access points have coordinated signal timing with Tweed Coast Road / Cudgen Road. The proposed access arrangement has been analysed in the following options:

- Option 1: left-in west access, signalised south access
- Option 2: priority west access, signalised south access
- Option 3: signalised west access, signalised south access
- Option 4: roundabout west access, signalised south access

The proposed access arrangement is illustrated in Figure 6 to Figure 9. SIDRA movement summaries for each scenario are included in Appendix 4.

**Figure 6: Option 1 - Left-in West Access, Signalised South Access (Source: Cottee Parker Architects, PSA)**

## **5.3 DESIGN TRAFFIC VOLUME**

Design traffic volumes have been calculated by adding the development traffic to the background traffic. The design traffic turning movement diagrams for 2026 and 2036 during both AM and PM peak period is Appendix 2.

## **5.4 SIDRA ANALYSIS**

### **5.4.1 2024 Base Case Scenario**

A summary of the intersection performance during 2024 base case scenario for AM and PM peak periods is outlined in Table 10 and full movement summary is included in Appendix 4.

The SIDRA analysis indicates that the surrounding road network is operating well below the performance threshold during 2024 base case, with a maximum DOS of 0.897. The critical movement within the network is the right turn from the south approach of Tweed Coast Road / Cudgen Road intersection, which has a LOS rating of D.

#### 5.4.2 2026 Opening Year Scenario

A summary of the LOS of the road network during 2026 opening year scenario for AM and PM peak periods is outlined in Table 11 and full movement summary is included in Appendix 4.

The SIDRA analysis indicates that the site access at Tweed Coast Road will have highest LOS of F in Option 2, while the site access at Cudgen Road will have highest LOS of E in Option 1. This suggests that the priority site access arrangement at Tweed Coast Road is not a viable option. Furthermore, having only one egress point at Cudgen Road indicates that the site access will reach near capacity, requiring either an additional egress point or redirection from Cudgen Road.

Furthermore, critical movements of Tweed Coast Road / Cudgen Road intersection are the right-turn movements of south and northwest approaches, reaching up to LOS E.

A summary of the DOS of the road network during 2026 opening year scenario for AM and PM peak periods is outlined in Table 12 and full movement summary is included in Appendix 4.

The SIDRA analysis indicates that only Option 2 will exceed DOS of 1.0 at the site access at Tweed Coast Road, with highest DOS of 14.422. This suggests that the priority site access arrangement at Tweed Coast Coad is not a viable option.

It should be noted that Tweed Coast Road is slated for an upgrade to a 4-lane road, which will increase capacity and improve performance of the surrounding road network.

#### 5.4.3 2036 10-Year Horizon Scenario

During the 2036 10-year horizon scenario, it is assumed that the upgrade of Tweed Coast Road will be fully constructed. Moreover, it is assumed that Tweed Valley Hospital will be operation at full capacity.

A summary of the LOS of the road network for 2036 10-year horizon scenario for AM and PM peak periods is outlined in Table 13 and full movement summary is included in Appendix 4.

**Table 13: 2036 Opening Year Road Network LOS (Source: SIDRA)**

The SIDRA analysis indicates that site access at Tweed Coast will operate below performance threshold in Options 1 and 4. Despite some options operating below performance threshold, Option 1 indicates that having only an egress at Cudgen Road will result in a site access performance of LOS F. Therefore, a full movement access arrangement at Tweed Coast Road is recommended.

A summary of the DOS of the road network during 2036 10-year horizon scenario for AM and PM peak periods is outlined in Table 14 and full movement summary is included in Appendix 4.

**Table 14: 2036 10-Year Horizon Road Network DOS (Source: SIDRA)**

The SIDRA analysis indicates that only Option 2 will exceed DOS of 1.0 at the site access at Tweed Coast Road, with highest DOS of 15.876. Meanwhile, only Option 1 will exceed DOS of 1.0 at the site access at Cudgen Road, with highest DOS of 3.938. This suggests that Options 1 and 2 are not a viable option.

#### 5.4.4 Recommended Access Arrangement

Based on the SIDRA analysis, a left-in (Option 1) and roundabout (Option 4) access arrangement at Tweed Coast Road allow the site access to operate below performance thresholds. However, SIDRA results indicates that Option 1 cannot accommodate all egress traffic at Cudgen Road and therefore an all-movement access arrangement at Tweed Coast Road is required. SIDRA results indicate that Option 4 will have an LOS F at the site access at Cudgen Road. To mitigate this, an access arrangement of roundabout access at Tweed Coast Road only has been assessed. Figure 10 illustrates the recommended access arrangement.

**Figure 10: Option 5 - Roundabout West Access (Source: Cottee Parker Architects, PSA)**

This access arrangement has been further tested in these two scenarios:

- Connection with Tweed Valley Hospital has been established
- Connection with Tweed Valley Hospital has not been established

A summary of the LOS of the road network for Option 5 during both with and without connection with Tweed Valley Hospital scenario is outlined in Table 15 and full movement summary is included in Appendix 4.

SIDRA analysis indicates that the recommended site access arrangement will have a highest LOS of E. The critical movements at the Tweed Coast Road / Cudgen Road intersection are the right-turn movements from the south and northwest approaches. It should be noted that the right-turn movement of the south approach is already performing at LOS E in the background scenario and therefore will not trigger a mitigation measure that was not needed in the background scenario. The LOS E for the northwest approach only occurs when no connection with Tweed Valley Hospital has been established. As traffic impact is further refined and analysed with future development application/s, review of the signal phasing is encouraged to ensure traffic network efficiency.

It has been observed that the LOS of Cudgen Road / Tweed Valley Hospital and Cudgen Road / Turnock Street intersections will reach up to LOS E. Due to an increase in through movement on Cudgen Road, the Tweed Valley Hospital access will experience increased delays, resulting in a worse LOS.

To support access and movement integration throughout the broader precinct, it is recommended that vehicle connections with Tweed Valley Hospital are pursued. Securing this outcome will ensure smoother traffic flow, and increase network efficiency at both Cudgen Road / Tweed Valley Hospital and Cudgen Road / Turnock Street intersections. Nonetheless, desktop analysis has identified sufficient width within the existing road reserve to accommodate improvement in Cudgen Road / Turnock Street intersection.

A summary of the DOS of the road network for Option 5 during both with and without connection with Tweed Valley Hospital scenario is outlined in Table 16 and full movement summary is included in Appendix 4.

SIDRA analysis indicates that no movement within the surrounding road network will exceed a DOS of 1.0.

Ultimately, Access Arrangement Option 5 is the access arrangement that will result in minimal impact to the surrounding network. To prevent increase delay in Tweed Valley Hospital access, it is recommended to establish connection with the proposed development.

To reaffirm, the abovementioned scenarios have been analysed without the planned ‘east-west’ connection road north of the site being delivered. Delivery of this planned infrastructure (see TRDS 2019) is anticipated to notably reduce southeast bound AM movements, and northwest bound PM movements within the Tweed Coast Road/Cudgen Road intersection. Notwithstanding, as previously detailed, the impact of these roads on trip distribution has not been modelled within the

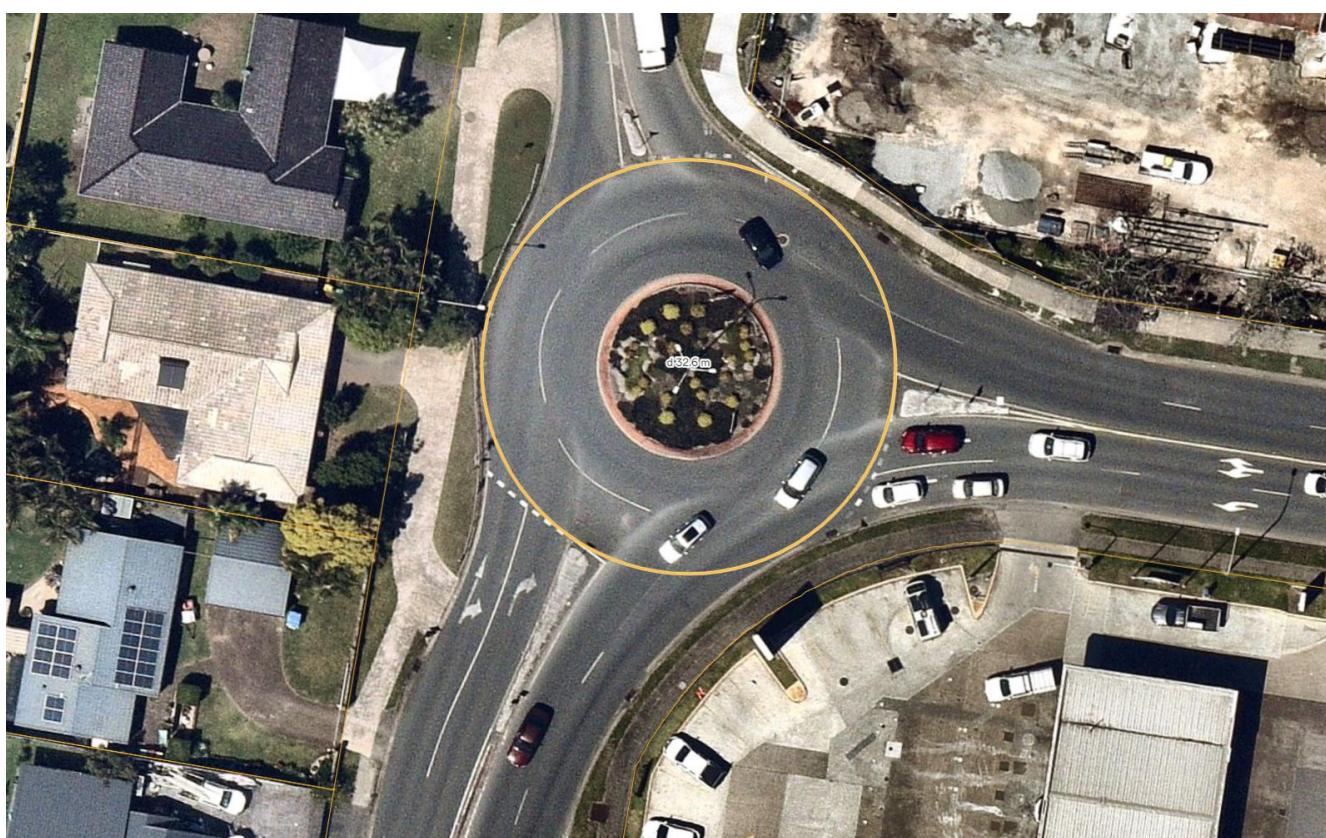

TRDS 2019 or like document available in the public domain. Accordingly, integration of these future roads through modelling into this TIA is inappropriate to pursue at this time.

The current road reserve along Tweed Coast Road, where the site access is located, is 30 m. Table 17 outlines the required minimum central island and circulating width for a two-lane roundabout outlined in Austroads Guide to Road Design Part 4B: Roundabouts. Section 2.2.1 indicates that Tweed Coast Road has a speed limit of 60 km/h. However, it should be noted that due to the close proximity of the Coast Tweed Road / Cudgen Road intersection, vehicles are expected to travel at speeds below 60 km/h.

**Table 17: Roundabout Design Requirement (Source: Austroads)**

FASTEST LEG SPEED	MINIMUM CENTRAL ISLAND RADIUS (2-LANE)	CIRCULATING WIDTH (DUAL TURN)	TOTAL ROUNDABOUT DIAMETER
50 km/h	8 m	9.7 m	35.4 m
60 km/h	14 m	8.8 m	45.6 m

Table 17 indicates that the required roundabout diameter for site access is 45.6 m. However, due to the close proximity to the Tweed Coast Road / Cudgen Road intersection, vehicles are expected to travel at speeds below 60 km/h. Therefore, a 35.4 m roundabout is deemed suitable for its purpose. As the road reserve is only 30 m, it is recommended that the proposed development dedicate land for the roundabout rather than encroaching on the opposite private land. Doing so will result in a minor realignment of Tweed Coast Road towards the site, however no capacity, safety, sight line or like concerns are identified in doing so. Figure 11 illustrates Darlington Drive / Leisure Drive roundabout which has a similar configuration with the proposed access arrangement.

**Figure 11: Darlington Drive / Leisure Drive Roundabout (Source: Nearmap)**

## 5.5 OTHER TRANSPORT CONSIDERATIONS

### 5.5.1 Public Transport Network

The desired inclusion of an on-site bus interchange is also indicated on the masterplan which would improve public transport accessibility for both Cudgen Connection and the Tweed Valley Hospital. The final inclusion of a bus interchange is subject to further design and consultation with TfNSW and local bus operators and will be pursued further post the rezoning process. The indicative/proposed bus routes are shown in Figure 12, with red being southbound buses and blue being northbound buses.

Figure 12: Indicative Bus Route (Source: Centuria Healthcare, PSA)

### 5.5.2 On-Site Parking and Servicing Requirements

The car parking and servicing requirements as specified by the TSC Development Control Plan Section A2 – Site Access and Parking Code are summarised below in Table 18.

Table 18: Parking and Servicing Requirements (Source: TSC)

LAND USE	CAR PARKING RATE	BICYCLE PARKING RATE	SERVICE VEHICLE
Worker Units	<ul style="list-style-type: none"> <li>1 space per 1 bedroom unit</li> <li>1.5 spaces per 2 bedroom unit</li> <li>2 spaces for 3 or more bedroom units</li> <li>1 space per 4 units for visitors</li> </ul>	<ul style="list-style-type: none"> <li>1 per unit for residents</li> <li>1 per 8 units for visitors</li> </ul>	-

LAND USE	CAR PARKING RATE	BICYCLE PARKING RATE	SERVICE VEHICLE
	<ul style="list-style-type: none"> <li>1 space per 30 beds for delivery/service vehicle parking</li> </ul>		
University Campus	<ul style="list-style-type: none"> <li>0.5 spaces per staff members, plus</li> <li>1 per 6 students, plus</li> <li>1 space for HRV service vehicle</li> </ul>	<ul style="list-style-type: none"> <li>1 per 100 part time students, plus</li> <li>1 per 200 full time students</li> </ul>	HRV
Medical Hotel	<ul style="list-style-type: none"> <li>1 space per staff member, plus</li> <li>1 space per room/unit for visitors, plus</li> <li>1 space for HRV service vehicle</li> </ul>	<ul style="list-style-type: none"> <li>1 per 4 staff members, plus</li> <li>1 per 10 units for visitors</li> </ul>	HRV
Medical Suites (Medical Centre)	<ul style="list-style-type: none"> <li>1.6 spaces per consulting room for staff, plus</li> <li>3.2 spaces per consulting room (GP), plus</li> <li>1.6 spaces per consulting room (specialists), plus</li> <li>1 space per 10 consulting room for HRV service vehicle</li> </ul>	<ul style="list-style-type: none"> <li>1 per 8 practitioners for employees, plus</li> <li>1 per 4 practitioners for visitors</li> </ul>	HRV
Childcare Centre	<ul style="list-style-type: none"> <li>1 space per staff member, plus</li> <li>1 space per 7.5 children, plus</li> <li>1 space for SRV service vehicle</li> </ul>	<ul style="list-style-type: none"> <li>1 per 4 staff members</li> </ul>	SRV
Shops	<ul style="list-style-type: none"> <li>1 space per 100m<sup>2</sup> for staff, plus</li> <li>3.5 spaces per 100m<sup>2</sup> for customers, plus</li> <li>1 per 1500m<sup>2</sup>, min 1, and min 2 for supermarkets for HRV service vehicle</li> </ul>	<ul style="list-style-type: none"> <li>2 per 100m<sup>2</sup> up to 100m<sup>2</sup>, and thereafter 1 per 200m<sup>2</sup></li> </ul>	HRV
Community facilities	<ul style="list-style-type: none"> <li>Assess on merit</li> </ul>		-

As shown in Table 18, the largest service vehicle that is required for the development would be a Heavy Rigid Vehicle (HRV). Parking requirements for the land uses are dependent on a mixture of floor area and full-time staff member numbers. As the project moves through the various design phases, parking should be provided at the appropriate rate and provision made for a HRV to access the site in an efficient manner.

### 5.5.3 Bushfire Risk Assessment

A desktop analysis of the local road network has been pursued to ensure any evacuation from the site can be appropriately facilitated within the existing road network. Egress from the site is limited to the proposed intersection with Cudgen Road, as such all egress is away from the primary bushfire hazard on the site (which is located along the northern boundary). Additional egress from the site through the TVH site may be facilitated by way of active and/or public transport connection, however this has been discounted for the purpose of these assessment.

Access to the east and west is facilitated from the proposed intersection. In addition, opportunities for north-south movements are via Tweed Coast Road (220m west of the Cudgen Road access intersection), or north via Turnock Street (approximately 800m east of the Cudgen Road access intersection). No issues of concern, such as lane or shoulder width, have been identified for these immediate, urban-grade roads within this TIA. Further, as per Section 4.3, SIDRA analysis has been carried out, identifying satisfactory traffic capacity within the immediate network, though limitations within peak times at the Tweed Coast Road/Cudgen Road intersection may be present until planned road networks are completed.

Whilst bushfire mapping overlays many of the roads within the site's immediate vicinity, established urban roads provide suitable access away from the site in every direction. Likewise, access outside bushfire mapping is available to the east, along Cudgen Road and McPhail Road to the Kingscliff Town Centre. From the Town Centre, access north and south is available outside of mapped bushfire areas.

Accordingly, the potential for the proposed development to be isolated in the event of a bushfire is low, as access to Cudgen Road moves away from the primary bushfire risk. From Cudgen Road, multiple access/egress routes are available, enabling movement north, south, east and west along urban standard roads. No deficiencies in road specifications have been identified. Finally, a route outside of current bushfire mapping to the Kingscliff Town Centre has been identified if required.

## 6. CONCLUSION

PSA Consulting has been engaged by Planit Consulting to prepare a TIA to accompany the Planning Proposal to amend the Tweed Local Environmental Plan 2014 relating to the development site, seeking to change the zoning from Primary Production to an urban zone. The development includes the construction of the proposed Cudgen Connection Health Precinct.

A summary of findings of the TIA are as follows:

- The development indicatively includes the construction of:
  - Five essential worker accommodation buildings (286 units in total)
  - Residential Recreation Space
  - Mental Health Hospital
  - Private Hospital and Medical Suites
  - University Campus
  - Medical Hotel (100 rooms)
  - Retail and Community Centre
  - Childcare Centre
  - Plaza
- The proposed development is expected to generate approximately 856 trips in the AM peak hour and 902 trips in the PM peak hour. This assumes there are no trip-chaining or co-use of the various land uses of the development. In reality, it is considered that there will be shared trip generation, which is expected to reduce the overall trip generation by approximately 30%.
- Further reduction in car trips is expected due to planned improvements in public and active transport infrastructure / facilities for both Cudgen Connection and Tweed Valley Hospital (TVH) developments.
- The development can be staged to respond to the infrastructure capacity limitations throughout time. The developer is open to entering a Planning Agreement with Tweed Shire Council (TSC) to limit the commencement of development to traffic network thresholds/capacity, as well as the highest permissible use within the proposed Land Use Zone.
- To ensure reductions in trip generation from the standard rates, a Green Travel Plan is proposed to be conditioned as a part of the future stages of assessment of the development.
- The SIDRA analysis indicates that the surrounding road network is operating well below the performance threshold during 2024 base case, with a maximum DOS of 0.897. The critical movement within the network is the right turn from the south and northwest approaches of Tweed Coast Road / Cudgen Road intersection, which has a LOS rating of D.
- The SIDRA analysis indicates that the site access at Tweed Coast Road will have highest LOS of F in Option 2, while the site access at Cudgen Road will have highest LOS of E in Option 1. This suggests that the priority site access arrangement at Tweed Coast Coad is not a viable option. Furthermore, having only one egress point at Cudgen Road indicates that the site access will reach near capacity, requiring either an additional egress point or redirection from Cudgen Road. Furthermore, critical movements of Tweed Coast Road / Cudgen Road intersection are the right-turn movements of south and northwest approaches, reaching up to LOS E.
- The SIDRA analysis indicates that only Option 2 will exceed DOS of 1.0 at the site access at Tweed Coast Road, with highest DOS of 14.422. This suggests that the priority site access arrangement at Tweed Coast Coad is not a viable option.
- The SIDRA analysis indicates that site access at Tweed Coast will operate below performance threshold in Options 1 and 4. Despite some options operating below performance threshold, Option 1 indicates that having only an egress at Cudgen Road will result in a site access performance of LOS F. Therefore, a full movement access arrangement at Tweed Coast Road is recommended.

- The SIDRA analysis indicates that only Option 2 will exceed DOS of 1.0 at the site access at Tweed Coast Road, with highest DOS of 15.876. Meanwhile, only Option 1 will exceed DOS of 1.0 at the site access at Cudgen Road, with highest DOS of 3.938. This suggests that Options 1 and 2 are not a viable option.
- Based on the SIDRA analysis, a left-in (Option 1) and roundabout (Option 4) access arrangement at Tweed Cost Road allow the site access to operate below performance threshold. However, SIDRA results indicates that Option 1 cannot accommodate all egress traffic at Cudgen Road and therefore an all-movement access arrangement at Tweed Coast Road is required. SIDRA results indicates that Option 4 will have an LOS F at the site access at Cudgen Road. To mitigate this, an access arrangement of roundabout access at Tweed Coast Road only has been assessed.
- This access arrangement has been further tested in these two scenarios:
  - Connection with Tweed Valley Hospital has been established
  - Connection with Tweed Valley Hospital has not been established
- SIDRA analysis indicates that the recommended site access arrangement will have a highest LOS of E. The critical movements at the Tweed Coast Road / Cudgen Road intersection are the right-turn movements from the south and northwest approaches. It should be noted that the right-turn movement of the south approach is already performing at LOS E in the background scenario and therefore will not trigger a mitigation measure that was not needed in the background scenario. The LOS E for the northwest approach only occurs when no connection with Tweed Valley Hospital has been established. As traffic impact is further refined and analysed with future development application/s, review of the signal phasing is encouraged to ensure traffic network efficiency.
- It has been observed that the LOS of Cudgen Road / Tweed Valley Hospital and Cudgen Road / Turnock Street intersections will reach up to LOS E. Due to an increase in through movement on Cudgen Road, the Tweed Valley Hospital access will experience increased delays, resulting in a worse LOS.
- To support access and movement integration throughout the broader precinct, it is recommended that vehicle connections with Tweed Valley Hospital are pursued. Securing this outcome will ensure smoother traffic flow, and increase network efficiency at both Cudgen Road / Tweed Valley Hospital and Cudgen Road / Turnock Street intersections. Nonetheless, desktop analysis has identified sufficient width within the existing road reserve to accommodate improvement in Cudgen Road / Turnock Street intersection.
- SIDRA analysis indicates that no movement within the surrounding road network will exceed a DOS of 1.0.
- Ultimately, Access Arrangement Option 5 is the access arrangement that will result in minimal impact to the surrounding network. To prevent increase delay in Tweed Valley Hospital access, it is recommended to establish connection with the proposed development.
- To reaffirm, the abovementioned scenarios have been analysed without the planned ‘east-west’ connection road north of the site being delivered. Delivery of this planned infrastructure (see TRDS 2019) is anticipated to notably reduce southeast bound AM movements, and northwest bound PM movements within the Tweed Coast Road/Cudgen Road intersection. Notwithstanding, as previously detailed, the impact of these roads on trip distribution has not been modelled within the TRDS 2019 or like document available in the public domain. Accordingly, integration of these future roads through modelling into this TIA is inappropriate to pursue at this time.
- The required roundabout diameter for site access is 45.6 m. However, due to the close proximity to the Tweed Coast Road / Cudgen Road intersection, vehicles are expected to travel at speeds below 60 km/h. Therefore, a 35.4 m roundabout is deemed suitable for its purpose. As the road reserve is only 30 m, it is recommended that the proposed development dedicate land for the roundabout rather than encroaching on the opposite private land. Doing so will result in a minor realignment of Tweed Coast Road towards the site, however no capacity, safety, sight line or like concerns are identified in doing so.
- The desired inclusion of an on-site bus interchange is also indicated on the masterplan which would improve public transport accessibility for both Cudgen Connection and the Tweed Valley Hospital. The final inclusion of a bus interchange is subject to further design and consultation with TfNSW and local bus operators and will be pursued further post the rezoning process.

- The TSC Site Access and Parking Code require the site to provide for both HRV and SRV vehicles for the various land uses.
- Sufficient land area is identified that will allow for parking to be provided at an appropriate rate as outlined in the TSC Development Control Plan Section A2 – Site Access and Parking Code.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

\* Critical Movement (Signal Timing)

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Accuracy Capacity Formula: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

All Vehicles			1769	3.5	1769	3.5	0.656	9.9	LOS A	9.9	71.2	0.60	0.53	0.60	44.9

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Two-Way Sign Control Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

P7	Full	1	29.3	LOS C	0.0	0.0	0.91	0.91	183.1	200.0	1.09
All Pedestrians		8	29.3	LOS C	0.0	0.0	0.91	0.91	183.1	200.0	1.09

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)

Pedestrian movement LOS values are based on average delay per pedestrian movement.

Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Accuracy Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Two-Way Sign Control Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)

Pedestrian movement LOS values are based on average delay per pedestrian movement.

Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Accuracy Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Green.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Override Site Data tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.
