LIST OF ILLUSTRATIONS

1. INTRODUCTION

This report has been prepared to accompany a planning proposal to Georges River Council for a medical centre to be located within Level 2 of an existing mixed-use development located at 84D Roberts Avenue, Mortdale (Figures 1 and 2).

This planning proposal seeks to amend the *Georges River Local Environmental Plan 2021* (*GRLEP 2021*) to allow a medical centre to be located within the existing Mortdale Plaza. The planning proposal envisages the partial fitout to Level 2 of the existing Mortdale Plaza for a medical centre with an approximate gross floor area of 600m^2.

The planning proposal proposes *no changes* to the existing building form, off-street parking facilities nor vehicular access arrangement.

It is envisaged that the proposed medical centre will cater primarily for the needs of employees working nearby and also local residents within the surrounding *E4 – General Industrial* and *R2 - Low Density Residential* zoned lands, including within the existing mixed used building itself.

Existing tenants within the development include a large Woolworths supermarket, BWS, a child care centre and a gymnasium. This will invariably reduce the traffic and parking implications when compared to other stand-alone medical centres as patients will undertake multi-purpose trips.

Off-street parking will be provided within the existing off-street car parking areas on site in accordance with Council's *DCP* requirements.

The purpose of this report is to assess the traffic and parking implications of the planning proposal and to that end this report:

- describes the site and provides details of the planning proposal

- reviews the road network in the vicinity of the site, and the traffic conditions on that road network

- reviews the public transport services available in the vicinity of the site

- estimates the traffic generation potential of the planning proposal and assigns that traffic generation to the road network serving the site

- assesses the traffic implications of the planning proposal in terms of road network capacity

- reviews the geometric design features of the proposed car parking and loading facilities for compliance with the relevant codes and standards

- assesses the adequacy and suitability of the quantum of off-street car parking and loading provided on the site.

SITE
FIGURE 2

2. PLANNING PROPOSAL

Site

The subject site is located on land zoned *E4 - General Industrial*, on the northern side of Roberts Avenue, between Depot Road and Fairway Avenue. The site has a street frontage approximately 15 metres in length to Roberts Avenue and occupies an area of approximately 1.12ha. A recent aerial image of the site and its surroundings is reproduced below.

Source: MetroMap

The subject site is currently occupied by the Mortdale Plaza, a local shopping plaza with established occupants comprising a café, pharmacy, a gymnasium, a child care centre, as well as a Woolworths supermarket (including BWS), within a three-storey mixed used building.

The floor area within Level 2 of the existing building – i.e. the level of the proposed medical centre – is approximately 2,140m^2 as follows:

Childcare Centre (Shop 6):	1,280m^2
Retail Tenancy (shop 7):	860m^2
TOTAL FLOOR AREA:	**2,140m^2**

In this regard, it is noted that the retail tenancy on Level 2 of the existing building has been *vacant*, and not been fitted out since the completion of the development.

Off-street parking on Level 2 of the Mortdale Plaza is currently provided for 34 cars.

The loading/servicing needs of the childcare centre are minimal, and are currently undertaken by a variety of light commercial vehicles such as vans, utilities and wagons, which are capable of fitting into a conventional car parking space.

Loading/servicing for the Woolworths Supermarket is undertaken by a variety of commercial trucks ranging from small, medium and large rigid trucks up to and including semi-trailers. A dedicated loading dock is provided for Woolworths on the ground floor level, along the north-western corner of the existing building.

Vehicular access to the car parking and loading facilities is provided via a two-way driveway off the Roberts Avenue roundabout, as shown in the image below.

Previously Approved Development Consents

The subject site has been granted a number of development consents, including MOD2013/0014 and DA2020/0452 which specify the following floor areas within the Mortdale Plaza development:

MOD2013/0014	
Ground floor – supermarket & pharmacy:	4,165m^2
Ground floor – café:	80m^2
First floor – gymnasium:	1,883m^2
Second floor – bulky goods retailing:	1,568m^2
Second floor – office space:	781m^2
TOTAL FLOOR AREA:	**8,477m^2**
DA2020/0452	
Second floor – childcare centre (94 children):	1,280m^2
TOTAL FLOOR AREA:	**1,280m^2**

Off-street parking for Mortdale Plaza is currently provided for a total of 422 cars within the existing building, including the 17 car parking spaces for the previously approved childcare centre on level 2.

Plans of the existing development have been prepared by *FLDC Architects* and *Liskowski Architects* and are reproduced in Appendix A.

Existing Planning Controls

The primary instrument that governs the types of land use permitted of the development on site is contained within the *Georges River Local Environmental Plan 2021* (*GRLEP 2021*). As noted in the foregoing, the subject site is located on land zoned *E4 - General Industrial* where a medical centre is not permitted, as it falls under 'Health services facilities' which are not permitted in *E4 - General Industrial* zoned lands.

Planning Proposal

GRLEP 2021 Schedule 1, Item 5 allows for additional permitted uses over the site, including retail premises and childcare centre, which are prohibited in the *E4 - General Industrial* zone. This planning proposal therefore seeks approval to include a medical centre as an additional permitted use on the subject site.

The proposed changes to the planning controls have the potential to achieve a fitout of the existing Mortdale Plaza building level 2 for a medical centre with a GFA of 600m^2.

As noted in the foregoing, the second level consists of two existing tenancies, a childcare centre catering to 94 children located within the front half of the level and fronting Roberts Avenue (shop 6), and a retail tenancy located within the rear half (shop 7).

Concept plans of the planning proposal shows the 600m^2 medical centre located within the back half of level 2 – i.e. "Shop 7" – and the remainder of the existing retail tenancy (approximately 238m^2 GFA) will remain vacant.

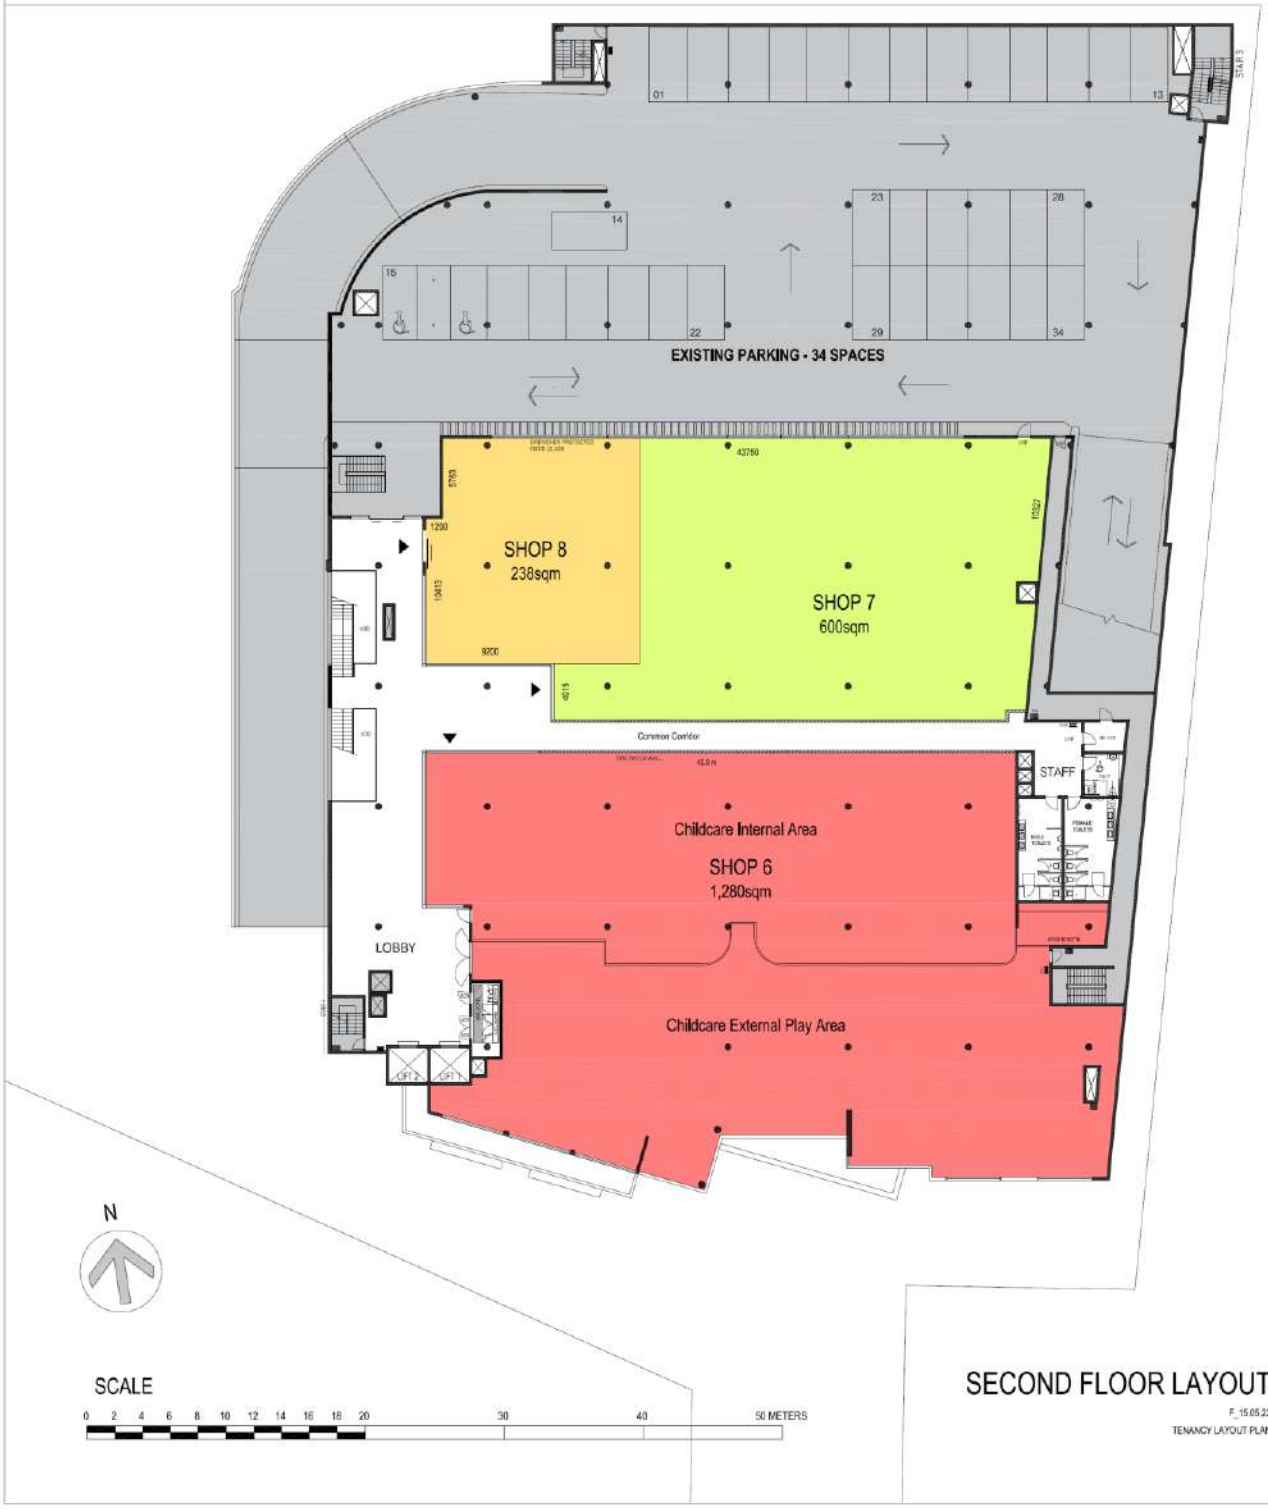
Off-street parking will be provided in the existing car parking areas on site in accordance with Council's *Georges River DCP 2021* and relevant Australian Standards requirements.

It is pertinent to note that the proposed parking allocation to the medical centre will *not* remove parking from "Shop 6" or any other approved tenancies, as detailed in Chapter 4 of this report.

No change is proposed to the geometric design layout of the proposed car parking areas, vehicular access or the proposed basement footprint, which are to be retained *unchanged*, consistent with existing development on site.

Concept plans of the planning proposal have been prepared by *Think Planners* and are reproduced in the following pages.

NOTE: AREAS AND LAYOUT (SHOP 7 & SHOP 8 BOUNDARIES) ARE INDICTIVE ONLY



3. TRAFFIC ASSESSMENT

Road Hierarchy

The road hierarchy allocated to the road network in the vicinity of the site by Transport for New South Wales (TfNSW) is illustrated on Figure 3.

Forest Road is classified by TfNSW as a *State Road* and provides the key east-west road link in the area, linking Peakhurst to Hurstville. It typically carries two traffic lanes in each direction in the vicinity of the site, with kerbside parking generally permitted outside of commuter peak periods.

Boundary Road is classified by TfNSW as a *Regional Road* and provides a key north-south road link in the area, linking Peakhurst to Oatley. It typically carries two traffic lanes in each direction in the vicinity of the site with additional lanes provided at key locations.

Roberts Avenue is a local, unclassified road which performs the function of an east-west *collector route* through the area. Kerbside parking is generally permitted on both sides of the road.

Existing Traffic Controls

The existing traffic controls which apply to the road network in the vicinity of the site are illustrated on Figure 4. Key features of those traffic controls are:

- a 50 km/h SPEED LIMIT which applies to Roberts Avenue and all other local roads in the area

- a ROUNDABOUT in Roberts Avenue where it intersects with Depot Road and also the subject site (No. 84D Roberts Road)

- GIVE WAY restrictions in Fairway Avenue where it intersects with Roberts Avenue

- a PEDESTRIAN REFUGE ISLAND located in Roberts Road, directly outside the site.

Existing Traffic Conditions

In order to gain an accurate appreciation of the existing traffic conditions on the road network in the vicinity of the site, peak period traffic surveys were undertaken as part of this traffic study on Wednesday 14th February 2024, at the following intersections:

- Roberts Avenue & Lorraine Street & Isaac Street
- Roberts Avenue & Site Access Driveway
- Roberts Avenue & Boundary Road & Universal Street

It is noted that the morning and afternoon "network" peak periods for the above traffic surveys are different from each other. Therefore, the "network" peak periods of the Roberts Avenue / Boundary Road / Universal Street intersection, 7:30am – 8:30am for the AM peak period and 5:00pm-6:00pm for the PM peak period, have been adopted for the purposes of this assessment.

The results of the traffic surveys are reproduced in full in Appendix B, revealing that:

- two-way traffic flows in Roberts Avenue are typically in the order of 1,654-1,971 vehicles per hour (vph) in the AM and PM peak hours

- two-way traffic flows in Lorraine Street are typically in the order of 709-746 vph in the AM and PM peak hours

- two-way traffic flows in Boundary Road are typically in the order of 1,502-1,890 vph in the AM and PM peak hours

- the traffic generation potential of the existing site at Site Access Driveway was in the order of 298-692 vph in the AM and PM peak hours.

Projected Traffic Generation

The traffic implications of development proposals primarily concern the effects of the *additional* traffic flows generated as a result of a development and its impact on the operational performance of the adjacent road network.

An indication of the traffic generation potential of the development proposal is provided by reference to the Roads and Maritime Services' publication *Guide to Traffic Generating Developments, Section 3 - Landuse Traffic Generation (October 2002).*

The RMS *Guidelines* are based on extensive surveys of a wide range of land uses and nominates the following traffic generation rates which are applicable to the development proposal:

Extended hours medical centre
8.8 peak hour vehicle trips per 100m^2 GFA

Application of the above traffic generation rate to the 600m^2 GFA of medical centre as outlined in the planning proposal yields a traffic generation potential of approximately 53 vph during both the *morning* and *afternoon* commuter peak periods.

That projected future level of traffic generation potential should however, be offset or *discounted* by the volume of traffic which could reasonably be expected to be generated by the approved/existing retail uses within the subject tenancy, in order to determine the *nett increase (or decrease)* in traffic generation potential expected to occur as a consequence of the planning proposal.

The RMS *Guidelines* nominates the following traffic generation rate which is applicable to the *approved* retail/commercial uses within "Shop 6" of the existing development:

Commercial Premises
2.0 peak hour vehicle trips per 100m^2 GFA

Application of the above "commercial premises" traffic generation rate nominated in the RMS *Guidelines* to the "Shop 7" partial floor area of 600m^2 yields a traffic generation potential of approximately 12 peak hour vehicle trips.

Accordingly, it is likely that the planning proposal will result in a *nett increase* in the traffic generation potential the site of approximately 41 vph during the weekday AM and PM peak periods.

In practice however, the planning proposal is expected to generate *somewhat less* traffic than the above traffic generation rates would suggest, because as noted in the foregoing, the medical centre as outlined in the planning proposal is expected to cater largely for patients living nearby and of employees working nearby within the surrounding *E4 – General Industrial* zone, including within the Mortdale Plaza complex itself. This will invariably reduce the traffic generation potential when compared to other stand-alone medical centres as patients will undertake multi-purpose trips.

Furthermore, whilst doctor's appointments are generally booked at 15 min to 30 min intervals, it is noted that a considerable number of consultations are now occurring over the phone or internet. This has resulted in a reduction in the number of patients needing to visit medical centres, and consequently a reduction in traffic and parking demands.

However, for a more conservative assessment it has been assumed that the existing "Shop 7" is vacant, and that *all* of the projected future traffic flows of 53 vph during both the AM and PM commuter peak periods, will be new or *additional* to the existing traffic flows currently using the adjacent road network.

That projected "increase" in the traffic generation potential of the site as a consequence of the planning proposal is minimal, and will clearly not have any unacceptable traffic implications in terms of road network capacity, as is demonstrated by the following section of this report.

Traffic Implications - Road Network Capacity

The traffic implications of development proposals primarily concern the effects that any *additional* traffic flows may have on the operational performance of the nearby road network.

Those effects can be assessed using the SIDRA program which is widely used by the TfNSW and many LGA's for this purpose. Criteria for evaluating the results of SIDRA analysis are reproduced in the following pages.

Roberts Avenue / Lorraine Street / Isaac Street Intersection

- the intersection currently operates at *Level of Service "A"* under the existing traffic demands during the weekday AM peak hour with total average vehicle delays in the order of 11.7 seconds/vehicle

- under the projected future traffic demands expected to be generated by the development proposal, the intersection is expected to continue to operate at *Level of Service "A"* during the weekday AM peak hour, with increases in total average vehicle delays of ***less than*** 1 seconds/vehicle

- the intersection currently operates at *Level of Service "A"* under the existing traffic demands during the weekday PM peak hour with total average vehicle delays in the order of 7.6 seconds/vehicle

- under the projected future traffic demands expected to be generated by the development proposal, the intersection is expected to continue to operate at *Level of Service "A"* during the weekday PM peak hour, with increases in total average vehicle delays of ***less than*** 1 seconds/vehicle.

Roberts Avenue / Site Access Driveway Intersection

- the intersection currently operates at *Level of Service "A"* under the existing traffic demands during the weekday AM peak hour with total average vehicle delays in the order of 5.5 seconds/vehicle

- under the projected future traffic demands expected to be generated by the development proposal, the intersection is expected to continue to operate at *Level of Service "A"* during the weekday AM peak hour, with increases in total average vehicle delays of ***less than*** 1 seconds/vehicle

- the intersection currently operates at *Level of Service "A"* under the existing traffic demands during the weekday PM peak hour with total average vehicle delays in the order of 8.9 seconds/vehicle

- under the projected future traffic demands expected to be generated by the development proposal, the intersection is expected to continue to operate at *Level of Service "A"* during the weekday PM peak hour, with increases in total average vehicle delays of ***less than*** 2 seconds/vehicle.

Roberts Avenue / Boundary Road / Universal Street Intersection

- the intersection currently operates at *Level of Service "C"* under the existing traffic demands during the weekday AM peak hour with total average vehicle delays in the order of 31.5 seconds/vehicle

- under the projected future traffic demands expected to be generated by the development proposal, the intersection is expected to continue to operate at *Level of Service "C"* during the weekday AM peak hour, with increases in total average vehicle delays of ***less than*** 1 seconds/vehicle

- the intersection currently operates at *Level of Service "C"* under the existing traffic demands during the weekday PM peak hour with total average vehicle delays in the order of 39.4 seconds/vehicle

- under the projected future traffic demands expected to be generated by the development proposal, the intersection is expected to continue to operate at *Level of Service "C"* during the weekday PM peak hour, with increases in total average vehicle delays of ***less than*** 3 seconds/vehicle.

The results of the SIDRA analysis of the surrounding intersections are also summarised on the table reproduced on the following page.

SIDRA Modelling Results

Intersection	Key Indicators	Existing AM Traffic Demand	Projected AM Traffic Demand	Existing PM Traffic Demand	Projected PM Traffic Demand
Roberts Avenue & Lorraine Street & Isaac Street	LoS	A	A	A	A
	DoS	0.880	0.888	0.784	0.792
	Delay	11.7	12.1	7.6	7.8
Roberts Avenue & Site Access Driveway	LoS	A	A	A	A
	DoS	0.693	0.717	0.855	0.879
	Delay	5.5	5.7	8.9	10.2
Roberts Avenue & Boundary Road & Universal Street	LoS	C	C	C	C
	DoS	0.789	0.809	0.932	0.961
	Delay	31.5	32.3	39.4	41.6

LoS = Levels of Service
DoS = Degree of Saturation
Delay = Total average vehicle delay (seconds per vehicle)

The detailed SIDRA *movements summaries* are reproduced in full in Appendix C, with criteria for evaluating the results of the analysis reproduced in the following pages.

In essence, the SIDRA capacity analysis has found that all intersections in the vicinity of the site will continue to operate at current *Levels of Service*, with *negligible* increases in average vehicle delays and that no road improvements or intersection upgrades will be required as a consequence of the planning proposal.

Criteria for Interpreting Results of Sidra Analysis

1. Level of Service (LOS)

LOS	Traffic Signals and Roundabouts	Give Way and Stop Signs
'A'	Good operation.	Good operation.
'B'	Good with acceptable delays and spare capacity.	Acceptable delays and spare capacity.
'C'	Satisfactory.	Satisfactory but accident study required.
'D'	Operating near capacity.	Near capacity and accident study required.
'E'	At capacity; at signals incidents will cause excessive delays. Roundabouts require other control mode.	At capacity and requires other control mode.
'F'	Unsatisfactory and requires additional capacity.	Unsatisfactory and requires other control mode.

2. Average Vehicle Delay (AVD)

The AVD provides a measure of the operational performance of an intersection as indicated on the table below which relates AVD to LOS. The AVD's listed in the table should be taken as a guide only as longer delays could be tolerated in some locations (ie inner city conditions) and on some roads (ie minor side street intersecting with a major arterial route).

Level of Service	Average Delay per Vehicle (secs/veh)	Traffic Signals, Roundabout	Give Way and Stop Signs
A	less than 14	Good operation.	Good operation.
B	15 to 28	Good with acceptable delays and spare capacity.	Acceptable delays and spare capacity.
C	29 to 42	Satisfactory.	Satisfactory but accident study required.
D	43 to 56	Operating near capacity.	Near capacity and accident study required.
E	57 to 70	At capacity; at signals incidents will cause excessive delays. Roundabouts require other control mode.	At capacity and requires other control mode.

3. Degree of Saturation (DS)

The DS is another measure of the operational performance of individual intersections.

For intersections controlled by traffic signals[1] both queue length and delay increase rapidly as DS approaches 1, and it is usual to attempt to keep DS to less than 0.9. Values of DS in the order of 0.7 generally represent satisfactory intersection operation. When DS exceeds 0.9 queues can be anticipated.

For intersections controlled by a roundabout or GIVE WAY or STOP signs, satisfactory intersection operation is indicated by a DS of 0.8 or less.

[1] *The values of DS for intersections under traffic signal control are only valid for cycle length of 120 secs.*

4. PARKING IMPLICATIONS

Existing Kerbside Parking Restrictions

The existing kerbside parking restrictions which apply to the road network in the vicinity of the site are illustrated on Figure 4. Key features of those parking restrictions are:

- NO STOPPING restrictions along both sides of Roberts Avenue, in the vicinity of the roundabout and pedestrian refuge island, including along the site frontage

- generally UNRESTRICTED kerbside parking elsewhere in Roberts Avenue and throughout the local area

- BUS ZONES located at regular intervals along both sides of Roberts Avenue including immediately east of the site.

Off-Street Parking Provisions

The off-street parking requirements applicable to the proposed development proposal are specified in Council's *Georges River Development Control Plan 2021 (Amendment No.3), Chapter 3.13 –Parking Access and Transport* document in the following terms:

> **Table 1 – Parking Requirements**
> **Specific Commercial / Retail – Non-residential accommodation development outside the Hurstville and Kogarah Strategic Centres**
> Medical Centre: ≥800m walking distance of Railway station – 1 space per 30m^2 (GFA)

Application of the above parking requirements to the medical centre as outlined in the planning proposal yields an off-street parking requirement of 20 car parking spaces.

The above parking requirements are satisfied by the proposed provision of 20 car parking spaces within the existing off-street car parking areas on site, thereby satisfying Council's *GRDCP 2021* requirements.

Notwithstanding, if the development was assessed as an entirely new application, the total development on the site would require the provision of 345 parking spaces, as set out below:

Georges River DCP 2021 – PARKING REQUIREMENTS		
		REQUIRED
Parking Provisions	**Supermarket/Pharmacy (4,248m^2):**	212.4 spaces
	Café (23m^2):	0.8 spaces
	Ground Floor Sub-Total:	**213.2 spaces**
	Gymnasium (1,817m^2):	81.8 spaces
	First Floor Sub-Total:	**81.8 spaces**
	Retail (238m^2):	5.9 spaces
	Childcare Centre (94 children & 16 staff):	23.7 spaces
	Medical Centre (600m^2):	20.0 spaces
	Sub-Total:	**49.6 spaces**
	TOTAL:	**344.6 spaces**

As noted in the foregoing, the Mortdale Plaza development provides for a total of 422 cars within the existing building. The above assessment therefore confirms that there will be adequate parking provided on-site for the medical centre as outlined in the planning proposal and all other existing uses.

The geometric design layout of the car parking facilities has been designed and constructed to comply with the relevant requirements specified in the Standards Australia publication *Parking Facilities Part 1 - Off-Street Car Parking AS2890.1* and *Parking Facilities Part 6 - Off-Street Parking for People with Disabilities AS2890.6* in respect of parking bay dimensions and aisle widths.

Conclusion

Based on the analysis and discussions presented within this report, the following conclusions are made:

- the planning proposal seeks approval to include a medical centre as an additional permitted use on the subject site, resulting in the potential for the fitout of the existing level 2 tenancy for a 600m^2 medical centre

- analysis based on the traffic generation rates published by TfNSW indicates that the proposed development will result in a *nett increase* in the traffic generation potential of the site of approximately 41 vph when compared with the previously approved uses on the site

- the SIDRA capacity analysis of the public road intersections in the vicinity of the site indicates that:

  - the projected "additional" traffic flows expected to be generated by the planning proposal (i.e. assuming that the site is currently vacant) indicates that there will be *no change* in current *Levels of Service* to any of the intersections located around the perimeter of the site, and

  - no road improvements or intersection upgrades would be required as a consequence of the planning proposal

- the future car parking facilities will be provided in accordance with Council's requirements and the relevant Australian Standards

- the future vehicular access arrangements will be via the existing vehicular access driveway in Roberts Avenue with *no changes* proposed.

It is therefore reasonable to conclude that the planning proposal will not have any unacceptable implications in terms of road network capacity or off-street parking/access requirements.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Intersection and Approach LOS values are based on average delay for all vehicle movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

* Critical Movement (Signal Timing)

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)
Pedestrian movement LOS values are based on average delay per pedestrian movement.
Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.
