

Hi Deepa,

As discussed, there are 4 windows in our property to be impacted by noise from the proposed development.

As a minimum, the acoustic barrier should run from the front access gate, run the full length of our house and to a point about 2-3M past the end of the house. The attached file shows a red line appended to the diagram in the area as indicated.

It remains our preferred solution to the noise problem that the bins storage area be located in the basement area of the building.

Regards,

Paul Micet
