This report is protected by copyright law and may only be reproduced, in electronic or hard copy format, if it is copied and distributed in full and with prior written permission by El.

#### **EXECUTIVE SUMMARY**

#### **Background**

Baraz Construction Pty Ltd engaged Environmental Investigations Australia Pty Ltd (EI) to conduct a Detailed Site Investigation (DSI) for site characterisation purposes for the property located at 47 Woodville Road, Chester Hill NSW (the site). This environmental assessment was completed to form part of a Development Application (DA) to Bankstown City Council for redevelopment of the site.

It is understood that the site is located on the eastern side of Woodville Road, covering an area of approximately 2,248 m<sup>2</sup>, currently occupied by AUS Mate Car Sales and Rentals Pty Ltd.

#### **Objectives**

The main objectives of the assessment were to:

- Evaluate the potential for site contamination on the basis of historical, anecdotal and documentary evidence;
- To investigate the degree of potential contamination by limited intrusive sampling and laboratory analysis; and
- Where site contamination is confirmed, make recommendations for the appropriate management.

#### **Findings**

The property identified as 47 Woodville Road, Chester Hill NSW, was the subject of a Detailed Site Investigation in order to assess for on-site contamination associated with the identified current and former land uses. Based on the findings of this assessment it was summarised that:

- At the time of the site walkover the site was in use and occupied by AUS Mate a car sales and rentals depot and car wash facility;
- Total site area was approximately 2,284 m<sup>2</sup>. Land use on surrounding lands was predominantly commercial and residential;
- Review of land title records and historical aerial photographs suggested that use of the site was primarily
  agricultural until the early 1950's when it was redeveloped for commercial uses. An Internet search for the
  business name "Leafvale Holdings Pty Ltd' owner of the site from 1985 to 2015 identified the proprietor as a
  motor vehicle dealership.
- A search of WorkCover NSW Authority records relating to the site was requested by EI. Correspondence
  dated 11 and 16 December 2015 (Ref: D15/203188) indicated a search of the Stored Chemical Information
  Database and the microfiche records held by WorkCover NSW did not locate any records relating to the site.
  Copies of the correspondences are provided in Appendix E.
- A search through the record of notices for contaminated land indicated that the site and lands in its vicinity (<</li>
   100 m) were free of statutory notices issued by the NSW EPA/OEH, and were not identified on the List of NSW contaminated sites notified to the EPA, or the POEO public register.
- Site walkover inspection did not identify the presence of underground petroleum storage systems (UPSS).

- Soil investigation was conducted at eight borehole locations (BH101M BH108) across accessible areas of the site to a maximum depth of 5.5 mBGL, with soil samples for environmental assessment purposes collected down to approximately 2.4 mBGL. A groundwater monitoring well was installed at one location upon completion of drilling, denoted as BH101M;
- The general site geology encountered during the soil investigation is described as a layer of anthropogenic filling overlying clayey soils and shale.
- Laboratory analytical results of tested soil samples were assessed against the health-based investigation level for residential sites with minimal access to soil (HIL-B) and recreational soil (HIL-C). The analytical results suggested the following:
  - Concentration of Lead (Pb) at the threshold of the adopted HIL criteria was reported in sample BH108\_0.13-0.23 (1,200 mg/kg). On review of the development plans for the proposed development this sampling location lies within the proposed extent of the basement and can be managed during the bulk excavation of the area. Results of tested natural material underlying Lead impacted fill soil were reported well within the adopted criterion indicating that the impacted lead soils had not leached to the natural material.
  - Free fibres and fragmented asbestos-containing material (ACM) was not identified in examined soils during field investigation.
- Due to the installation of only one (1) groundwater monitoring well during the investigation, determination of groundwater flow direction and background groundwater quality could not be established. Elevated concentrations in excess of the adopted GILs were not reported in groundwater sample 101M.
- The following data gaps identified in this DSI will require closure by further investigations:
  - Potential presence of hazardous materials present within site structures.

Based on the findings of the DSI and with consideration of the Statement of Limitations (Section 13), El concludes that widespread contamination was not identified and the site is considered suitable for the proposed residential development provided the following recommendations are implemented.

#### Recommendations

Based on the findings of this investigation, the following recommendations are provided:

- Prior to site demolition, carry out a Hazardous Materials Survey on existing site structures to identify
  potentially hazardous building products that may be released to the environment during demolition;
- Any material being removed from site (including virgin excavated natural materials (VENM)) should be classified for off-site disposal in accordance the EPA (2014) Waste Classification Guidelines; and
- Any material being imported to the site should be assessed for potential contamination in accordance with NSW EPA guidelines as being suitable for the intended use or be classified as VENM.

# 1. INTRODUCTION

## 1.1 BACKGROUND AND PURPOSE

Mr Nadeem Baraz of Baraz Construction Pty Ltd (the Client) engaged Environmental Investigations Australia Pty Ltd (EI) to conduct a Detailed Site Investigation (DSI) for site characterisation purposes of the property located at 47 Woodville Road, Chester Hill NSW (the site).

As shown in **Figure 1**, the site is located approximately 20 km east of the Sydney central business district. The site is cadastrally identified as Lot 101 DP 733399, and covers a total area of approximately 2,248 m<sup>2</sup>.

This assessment was conducted to form part of a Development Application (DA) to Bankstown City Council for redevelopment of the site involving the demolition of existing buildings and erection of a 3 storey residential development with basement parking. It is understood that the site is located on the western side of Bridges Road and is currently occupied by AUS Mate a company specialised in car sales and rentals. The site layout is presented in Figure 2.

#### 1.2 PROPOSED DEVELOPMENT

At the time of report preparation, El was provided with the following drawings prepared by Ghazi Al Ali Pty Ltd:

- "Site Plan", Drawing No. A 1010
- "North Elevation", Drawing No. A1500
- "South Elevation", Drawing No. A1501
- "East Elevation", Drawing No. A1502
- "West Elevation", Drawing No. A1503

Based on the above drawings, El understand that the proposed development comprises demolition of existing site structures and a construction of a 3 storey residential development with associated basement car parking facilities and communal open space. Proposed development plans are presented in **Appendix A**.

#### 1.3 REGULATORY FRAMEWORK

The following regulatory framework and guidelines were considered during the preparation of this report:

- ANZECC & ARMCANZ (2000) Australian and New Zealand Guidelines for Fresh and Marine Water Quality;
- DEC (2007) Guidelines for the Assessment and Management of Groundwater Contamination;
- DEC (2006) Guidelines for the NSW Site Auditor Scheme (2nd Edition);
- EPA (1995) Sampling Design Guidelines;
- NEPM (2013) Schedule B(1) Guideline on Investigation Levels for Soil and Groundwater,
- NEPM (2013) Schedule B(2) Guideline on Site Characterisation;

- Contaminated Land Management Act (1997); and
- OEH (2011) Guidelines for Consultants Reporting on Contaminated Sites.

#### 1.4 PROJECT OBJECTIVES

The primary objectives of this investigation were to:

- Evaluate the potential for site contamination on the basis of historical land uses, anecdotal and documentary evidence of possible pollutant sources;
- Investigate the degree of any potential contamination by means of limited intrusive sampling and laboratory analysis, for relevant contaminants; and
- Where site contamination is confirmed, make recommendations for the appropriate management of any contaminated soils and/or groundwater.

#### 1.5 SCOPE OF WORKS

In order to achieve the above objectives, the scope of works was as follows:

#### 1.5.1 Desktop Study

- A review of relevant topographical, geological, hydrogeological and soil landscape maps for the project area;
- Search of historical aerial photographs archived at NSW Land and Property Information to review previous site use and the historical sequence of land development in the neighbouring area;
- A land titles search conducted through NSW Land and Property Information for information relating to historical ownership of the site;
- A search of Bankstown City Council records for information relating to operational site history and/or relevant environmental incidents;
- A search of NSW EPA Land Information records under the Contaminated Land Management Act (1997) and Protection of the Environment Operations Act (1997);
- A search of the Stored Chemical Information Database (SCID) and microfiche records held by WorkCover
   NSW relating to possible underground tank approvals and locations, and storage of dangerous goods; and
- A review of existing underground services on site.

#### 1.5.2 Field Work & Laboratory Analysis

- A detailed site walkover inspection;
- Drilling boreholes at eight locations across targeted and accessible areas of the site. (refer to Section 6.1);

- Installation of one groundwater monitoring wells to a maximum depth of 5.5 m, constructed to standard environmental protocols to investigate potential groundwater contamination. (refer to **Section 6.1**);
- Multiple level soil sampling within fill and natural soils and one round of groundwater sampling from the newly constructed groundwater monitoring wells; and
- Laboratory analysis of selected soil and groundwater samples for relevant analytical parameters as determined from the site history survey and field observations during the investigation programme.

# 1.5.3 Data Analysis and Reporting

A DSI report would be prepared to document desk study findings, the conceptual site model, data quality objectives, investigation methodologies and results. The report would provide a record of observations made during the detailed site walkover inspection, borehole and monitoring well construction logs and a discussion of laboratory analytical results in regards to potential risks to human health, the environment and the aesthetic uses of the land.

# 2. SITE DESCRIPTION

# 2.1 PROPERTY IDENTIFICATION, LOCATION AND PHYSICAL SETTING

The site identification details and associated information are presented in **Table 2-1**, while the site locality is shown in **Figure 1**.

Table 2-1 Site Identification, Location and Zoning

Attribute	Description
Street Address	47 Woodville Road, Chester Hill NSW
Location Description	Approx.20km east of Sydney CBD, located on the eastern side of Woodville Road. The site is bounded by a Commercial Building (north), a vacant lot (south), residential properties east and Woodville Road west.
	North-eastern corner of site: GDA94-MGA56 Easting: 313979.381, Northing: 6250771.415 (Source: http://maps.six.nsw.gov.au)
Site Area	2,284 m²
Lot and Deposited Plan (DP)	Lot 101 DP 733399
State Survey Marks	Two State Survey Marks were identified in proximity to the site. PM 15278 situated on the eastern boundary of the site, and PM640 on the eastern side of the site across Woodville Road. (Source: http://maps.six.nsw.gov.au)
Local Government Authority	Bankstown City Council
Parish	Liberty Plains
County	Cumberland
Current Zoning	B1 – Neighbourhood Centre (Land Zoning Map Sheet LZN_001, Bankstown Local Environment Plan 2015)
Current Land Uses	Commercial

At the time of this assessment the site was occupied by AUS Mate, a company specialised in car sales and rentals. The assessment area is illustrated in Figure 2.

# 2.2 SURROUNDING LAND USE

The site was situated within an area of predominantly commercial / residential land use. Current uses of surrounding lands are described in **Table 2-2**.

Table 2-2 Surrounding Land Uses

Direction Relative to Site	Land Use Description	
North	Commercial, then residential properties	
South	Vacant lot then residential properties	Ш
East	Residential properties	
West	Woodville Road then residential properties	

Sensitive land uses, included Old Guildford Public High School located across Woodville Road south-east of the site.

#### 2.3 REGIONAL SETTING

Regional topography, geology, soil landscape and hydrogeological information are summarised in Table 2-3.

Table 2-3 Regional Setting Information

Attribute	Description
Topography	The regional topography consists gently undulating rises on Wianamatta Shale with local relief 10-30m, sloped <10%. The local topography was gently undulating with a 10% downward slope to the west.
Site Drainage	Based on observations on-site, stormwater is anticipated to be diverted by pit and pipe drainage to the municipal stormwater system.
Regional Geology	With reference to the Department of Mineral Resources, Geological Series Sheet 9130, Penrith the site comprises shale, caebonaceous claystone, laminate, fine to medium grained lithic sandstone rancoal and tuff.
Soil Landscapes	The Soil Conservation Service of NSW Soil Landscapes of the Penrith 1:100,000 Sheet (Bannerman S.M. and Hazelton, P.A., 1990) indicates that the site likely overlies the Blacktown (bt) Landscape, which typically comprises friable brownish black loam, hardsetting brown clay loam, strongly pedal, mottled brown light clay and light grey plastic mottled clay.
Acid Sulfate Soil Risk	In accordance with the <i>Bankstown Local Environmental Plan</i> (Acid Sulfate Soil Map Sheet ASS_01, Bankstown City Council, 2015 does not lie under any class of acid sulfate soils. The need for Acid Sulphate soil management was therefore considered unwarranted and the risks associated with Acid Sulphate soils were considered negligible.
Groundwater Flow Direction	Based on observations on-site, groundwater is anticipated to flow on a westerly direction be diverted by gutter drains and downpipes to municipal stormwater system or as subsurface infiltration or overland flow, ultimately draining to Prospect Creek.
Nearest Surface Water Feature	Prospect Creek 2.5 km west of the site and Duck River 2.3 km east of the site. It is anticipated that water from Prospect Creek would ultimately discharge to Georges River, approximately 5 km southeast of the site while water from Ducks River to Parramatta River north-east of the site.

# 2.4 GROUNDWATER BORE RECORDS AND LOCAL GROUNDWATER USE

An online search of registered groundwater bores was conducted by EI on 22 December 2015 through the NSW Office of Natural Resources (Ref. <a href="http://allwaterdata.water.nsw.gov.au/water.stm">http://allwaterdata.water.nsw.gov.au/water.stm</a>). There were no registered bores

within 1 km of the site of the site. The nearest identified bores and their direction and distance from the site are listed in **Table 2-4**.

Table 2-4 Summary of Selected Registered Groundwater Bores

Bore No.	Direction and approx. Distance (m)	Date Drilled	Drilled Depth (m)	\$WL	Bore Purpose
GW112616	W – 1.4 KM	2010	6	2	Monitoring
GW112617	W – 1.4 KM	2010	6	<u> </u>	Monitoring
GW112618	W – 1.4 KM	2010	6	5#1	Monitoring

Notes: - Data not recorded; \* SWL - Standing water level measured in m BGL

Three registered bores were identified in proximity of the site, being recorded as monitoring bores. Given the available reticulated water supply in the region, the likelihood of groundwater being used for drinking purposes in the local area was considered to be low. A map showing the locations of the identified bores is provided in **Appendix B**.

#### 2.5 SITE WALKOVER INSPECTION

El staff made a number of observations during a detailed site inspection on 10 December 2015. The recorded observations are summarised below with photographic log provided in **Appendix C**.

#### 2.5.1 General Site Observations

- The site is occupied by a commercial structure and associated garages and sheds and a car park capped with concrete pavement which fronts onto Woodville Road extending to Alpha Street;
- Surrounding land use noted during the inspection included a Caltex petrol station down gradient to the north, a
  grassland covered vacant lot followed by residential dwellings to the south, residential dwellings to the east and
  Woodville Road followed by a Caltex petrol station to the west;
- At the time of the site walkover the site was in use and occupied by AUS Mate a car sales and rentals depot and car wash facility;
- At the time of the site walkover a car park covered by concrete pavement occupied most of the site. Various cars for sale and rental purposes were noted on the carpark. Minor, localised cracking and occasional minor oil staining and varying patches was noted on the concrete pavement;
- A concrete and tiled roof one storey building in used for administrative purposes was situated on the north eastern side of the site. The existing building appeared to be in good condition.
- Four garages constructed in brick and aluminium roofing were situated east of the office building. Scrap
  materials such as tires, wood, metal sheeting, old chairs, carpets and bicycles were noted on the storage areas;
- A shipping container constructed in aluminium of unknown content was situated at the eastern side of the yard;

- A shed constructed in aluminium was situated on the south eastern corner of the site, caustic degreaser, Suds N
  Wax concentrate exterior shampoo with synthetic polymer wax, Omikron car deodorizer, and a 25 L container of
  Shell X55 solvent were noted to be stored inside the shed.
- Water drainage systems were noted at different locations adjacent to the sheds on the northern and southern side of the site;
- · Open car parking areas sloped slightly towards the west; indicating possible site grading works in the past; and
- Evidence of underground petroleum storage systems (UPSS) was not observed during the inspection.

# 2.5.2 Observations of Hazardous Building Materials

- Site observations indicate the potential presence of asbestos containing materials (ACM) on the interior of the building structures; and
- Site observations indicated that lead based paints may have been used on site structures.

# 3. PREVIOUS INVESTIGATIONS

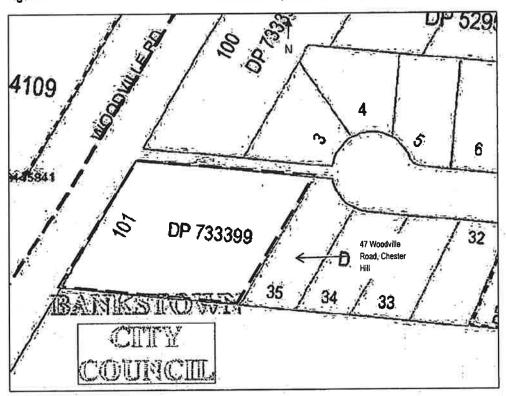

El was not made aware of any previous environmental investigations conducted at the site.

# 4. SUMMARY OF SITE HISTORY AND SEARCHES

# 4.1 SITE LAND TITLES INFORMATION / HISTORIC AERIAL REVIEW

Historical land titles search for the site was conducted through Legal Liaison Services Pty Ltd. Copies of relevant documents, including detailed land title transfer records resulting from this search are presented in **Appendix D**. The land title search found 47 Woodville Road, Chester Hill comprised one allotments. The approximate outline of the allotment is shown in **Figure 4-1**.

Figure 4-1 Title Division within 47 Woodville Road, Chester Hill

A summary of all the previous and current registered proprietors along with information obtained from the available historical aerial photographs, in relation to past potential land uses are presented in **Table 4-1**.

The historical aerial photographs reviewed as part of this DSI included:

- 1930: 10 February 1930, Map 3429, Run 27, B/W;
- 1943: Sydney 1943 Imagery (source : http://maps.six.nsw.gov.au/);
- 1955: August 1955, Run 21, B/W, NSW 224-5024 Lands Photo;
- 1961: 1961, Run 34, B/W, NSW 1050-5114 Lands Photo;
- 1982: 9 August 1982, Run 22, B/W, NSW 3241/152 Lands Photo;
- 1994: 4 October 1994, Run 10, NSW 4244 Department of Lands;

- 2005: 10 December 2005, Run 10, NSW 4937 (M2510) Department of Lands; and
- 2015: 2015 Aerometrex Imagery (accessed on Google Earth)

Table 4-1 Summary of Owners and Historical Aerial Photography

Period	List of Owners in the Period (Refer to Appendix D for further details)	Site description based on historical aerial photographs	Potential Land Uses
1917 to 1929	Harry Bertram Gazzard (Carpenter) Albert Ernest Gazzard (Hotel Manager)	1930: The site appears to be agricultural land, a building structure is	Agricultural
1929	Gertrude Caroline Andrews (Widow) Albert Ernest Gazzard (Hotel Manager) (Transmission Application not investigated)	noted on the north eastern side of the site, and second small structure presumed to be a dwelling on the north western corner of the site.	Agricultural
1929 to 1951	Albert Ernest Gazzard (Hotel Manager, now Poultry Farmer)	1945: No major changes noted in the property from the 1930 aerial.	Agricultural
1951 to 1975	Evelyn Marie Weeks (Married Woman)	1955: Previously noted structures appear to remain on site.	Commercial
1		1961: Previously noted structures on the north eastern side of the site appear to have been demolished. A structure is on the north western corner of the site and a few additional small sheds are noted on site,	
1975 to 1985	Vinbee Trading Pty Limited	1994: A paved car park is noted to the north of the property.	Commercial
1985 to 2015	Leafvale Holdings Pty Ltd	<u>2015:</u> No major changes noted in the property from the 1994 aerial.	
		1982: The site seems to be occupied by commercial structures to the north. What appears to be a concrete paved open car park occupies the larger section of the site.	
		2005: No major changes noted in the property from the 1982 aerial.	
2015 to date	# Baraz Construction Pty Limited	2015: A commercial building structure is noted to the north western corner of the site. Associated garages are noted adjacent to the structure to the east. A concrete paver open carpark is noted	Commercial
	**	occupying the larger section of the site.	

#### Leases:

09.03.1971 to Vinbee Trading Pty Limited – expired 20.04.1976

## Easements: - NIL

Land title records and historical aerial photographs suggested that use of the site was primarily agricultural until the early 1950's when it was redeveloped for commercial uses. An Internet search for the business name "Leafvale Holdings Pty Ltd' owner of the site from 1985 to 2015 identified the proprietor as a motor vehicle dealership.

# 4.2 SURROUNDING LANDS HISTORICAL AERIAL PHOTOGRAPHY REVIEW

As part of the Historical Aerial Review, an assessment of surrounding land uses using historical aerial photographs sourced from NSW Land and Property Information was carried out. A summary of the pertinent information identified at surrounding land parcels from the reviewed photographs is presented in **Table 4-2**.

Table 4-2 Summary of Aerial Photograph Review

Aerial Photograph	Surrounding land uses based on historical aerial photographs
1930: 10 February 1930, Map 3429, Run 27, B/W	Surrounding land use was predominately agricultural, a residential development is noted further to the north east of the site.
1943: Sydney 1943 Imagery (source : http://maps.six.nsw.gov.au/)	No major changes noted the dominant uses on surrounding lands remained as agricultural and residential further to the north east.
1955: August 1955, Run 21, B/W, NSW 224-5024 – Lands Photo	Areas north and south of the site were occupied by agricultural land followed by likely residential properties, area east of the site was dominated by agricultural properties. New residential dwellings are situated west of the site.
1961: 1961, Run 34, B/W, NSW 1050- 5114 – Lands Photo	A few commercial structures are noted north of the site, a vacant lot is situates south of the site followed by residential dwellings, properties to the east and west are predominately occupied by new residential developments.
1982: 9 August 1982, Run 22, B/W, NSW 3241/152 – Lands Photo	Properties to the north are occupied by what appear to be a few commercial structures, to the south by a vacant lot and to the east by residential dwellings. Land uses to the south west appear to be commercial and to the north west predominately residential.
1994: 4 October 1994, Run 10, NSW 4244  – Department of Lands	The dominant uses on surrounding lands remained commercial then residential to the north, vacant lot then residential to the south, high density residential to the east and commercial to the south west and residential to the north west.
2005: 10 December 2005, Run 10, NSW 4937 (M2510) - Department of Lands	No major changes noted in the property from the 1994 aerial.
2015: 2015 Aerometrex Imagery (accessed on Google Earth)	A petrol station is noted to the north of the site, a vacant lot remains on the southern side, the eastern side is predominately occupied by residential dwellings, a petrol station is situated on the north western side across Woodville Road, Old Guildford Public school followed by residential properties is situated to the south east of the site.

#### 4.3 COUNCIL INFORMATION

A search of historical records held by Bankstown City Council pertaining to the site was requested by EI. Correspondences dated 17 December 2015 from Bankstown City Council indicated one file related to 47 Woodville Road, Chester Hill was identified in Council records. A summary of the file is presented in **Table 4-3**.

Table 4-3 Record Archived at Bankstown City Council

Period / Year	Address	Document Reference	Description
2014	47 Henderson St	DA/300-2013	Demolition of existing structures and the construction of a residential use development containing 6 shops, 20 residential units, first floor open space and associated on – site car parking and landscaping.
			Decision: Refusal of consent, January 2014.

#### 4.4 WORKCOVER NSW AUTHORITY SEARCH

A search of WorkCover NSW Authority records relating to the site was requested by El. Correspondences dated 11 and 16 December 2015 from the Dangerous Goods Licensing Section indicated a search of the Stored Chemical Information Database and the microfiche records held by WorkCover NSW did not locate any records relating to the site. Copies of the correspondences are provided in **Appendix E**.

# 4.5 HAZARDOUS CHEMICALS AND REGULATORY COMPLIANCE

# 4.5.1 Contaminated Land - Record of Notices under Section 58 of CLM Act (1997)

On 22 December 2015, an on-line search of the Contaminated Land – Record of EPA Notices was conducted, this being a database that is maintained by the NSW OEH. Section 58 of the CLM Act 1997 relates to the investigation, remediation and management of sites where contamination poses a significant risk of harm and includes Sections 35 and 36 of the Environmentally Hazardous Chemicals Act 1985. This search confirmed that the NSW OEH has no regulatory involvement under Section 58 of the Contaminated Land Management Act 1997 in relation to the property identified as 47 Woodville Road, Chester Hill NSW.

#### 4.5.2 List of NSW Contaminated Sites Notified to EPA

A search through the List of NSW Contaminated Sites notified to the EPA under Section 60 of the CLM Act 1997 was conducted by El on 22 December 2015. This list is maintained by NSW EPA and includes properties on which contamination has been identified. Not all notified land is deemed to be impacted significantly enough to warrant regulation by the EPA. Review of the database indicated the site had not been notified as contaminated to the EPA.

#### 4.5.3 POEO Public Register

A search of the *Protection of the Environment Operations (POEO) Act Public Register* on 13 October 2015, did not identify environmental protection licences, applications, notices, audits, pollution studies, and reduction programmes records pertaining to the site or properties within 1.0 km of the site.

# 5. PRELIMINARY CONCEPTUAL SITE MODEL

In accordance with NEPM (2013) Schedule B2 – Guideline on Site Characterisation and to aid in the assessment of data collection for the site, a preliminary conceptual site model (CSM) was developed to assess plausible linkages between potential contamination sources, migration pathways and receptors. The preliminary CSM was derived based on desktop study findings and provided a framework to review the reliability and useability of collected data and to identify data gaps in site characterisation works.

# 5.1 CHEMICAL HAZARDS AND CONTAMINATION SOURCES

On the basis of site inspection findings, site history, and search findings (described in **Section 4**), El considered the potential chemical hazards and onsite contamination sources to be as follows:

- Impacts from importation of fill materials of unknown origin and quality;
- Impacts from long-term historical commercial use of the site including, spills and leaks from site storage areas and vehicle parking;
- Impacts from potential contamination form leaks / spills chemical storages of degreasers and solvents, hoist areas, and waste oil storage;
- Potential residues from pesticides use;
- Deeper, natural soils containing residual impacts, representing potential secondary sources of contamination;
- Potential groundwater contamination from on-site and unknown off-site sources;
- Impacts from unknown offsite sources of contamination;
- Weathering of building structures (i.e. painted surfaces, metallic structures, etc.);and
- Hazardous building products present in existing structures.

#### 5.2 CHEMICALS OF CONCERN

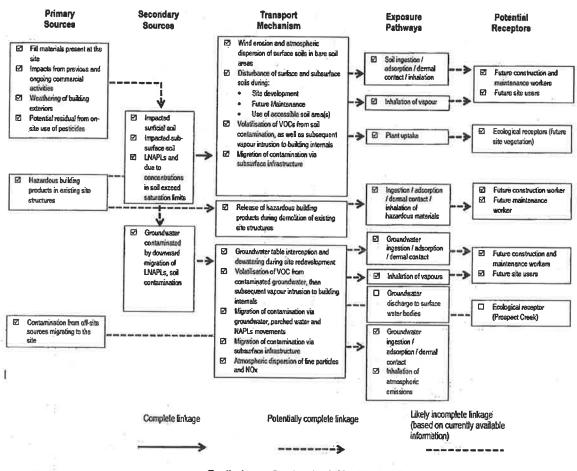

Based on the findings of the site history review the potential chemicals of concern at the site were considered to be:

- Soil heavy metals (HMs), total recoverable hydrocarbons (TRH), polycyclic aromatic hydrocarbons (PAH), the monocyclic aromatic hydrocarbon (MAH) compounds benzene, toluene, ethylbenzene and xylenes (BTEX), organochlorine and organophosphorus pesticides (OCP/OPP), polychlorinated biphenyls (PCB), phenolic compounds, volatile organic compounds (VOC), and asbestos; and
- Groundwater HMs, TRH, BTEX, PAH, VOCs.

# 5.3 POTENTIAL SOURCES, EXPOSURE PATHWAYS AND RECEPTORS

Potential contamination sources, exposure pathways and human and environmental receptors that were considered relevant for this assessment are summarised in Figure 5-1.

Preliminary Conceptual Site Model

Source: based on NEPM schedule B4 HRA Methodology

Figure 5-1 Preliminary Conceptual Site Model

#### 5.4 DATA GAPS

Based on the preliminary conceptual site model derived for the site, the following data gaps were identified:

- The presence of onsite contamination from identified sources (listed in Section 5.1) requires confirmation;
- The degree and extent of onsite contamination, if any; and
- Potential presence of any contamination from other unknown onsite and offsite sources.

# 6. SAMPLING, ANALYTICAL AND QUALITY PLAN (SAQP)

The SAQP plays a crucial role in ensuring that the data collected as part of this, and ongoing environmental works carried out at the site are representative, and provide a robust basis for site assessment decisions. This SAQP includes the following:

- Data quality objectives, including a summary of the objectives of the DSI;
- Investigation methodology including media to be sampled, details of analytes and parameters to be monitored and a description of intended sampling points;
- Sampling methods and procedures;
- Field screening methods;
- Analysis methods;
- Sample handling, preservation and storage; and
- Analytical QA/QC.

# 6.1 DATA QUALITY OBJECTIVES (DQO)

In accordance with the DEC (2006) *Guidelines for the NSW Site Auditor Scheme*, the process of developing Data Quality Objectives (DQO) was used by the EI assessment team to determine the appropriate level of data quality needed for the specific data requirements of the project. The DQO process that was applied for this assessment is documented in **Table 6-1**.

# Table 6-1 Summary of Project Data Quality Objectives

DQO Steps (NSW DEC, 2006)	Details	Comments
State the Problem  Summarise the contamination problem that will require new environmental data, and identify the resources available to resolve the problem; develop a conceptual site model	<ul> <li>The site structures are to be demolished and the site is to be redeveloped into a residential development with associated on site car parking facilities and a landscaping.</li> <li>Historical information and site inspection identified the potential for contamination of soils and/or groundwater, contributed by various potential contamination sources listed in Section 4: Based on the site history information collected, a preliminary conceptual site model of the site has been developed, and is presented in Section 5.</li> </ul>	To enable DSI assessment, El has adopted the approach that the proposed development will meet the definition of HIL. B type development Residential with minimal opportunities for soil access (NEPM, 2013). In addition, it was assumed that areas beyond the proposed basement excavation extent would be deep
	<ul> <li>The investigation sampling must provide supportive information on the environmental conditions of the site to determine the site's suitability for the proposed development.</li> </ul>	soil zones to be used for landscaping. HIL C – Recreational / Open Space soil criteria are considered in this report to assess the suitability of site soils to be retained on-site for landscaping or gardening purposes in communal site areas.
2. Identify the Goal of the Study (Identify the decisions) Identify the decisions that need to be	Based on the objectives outlined in Section 1.4, the decisions that need to be made are:  Has the nature, extent and source of any soil, vapour and/or groundwater impacts onsite been defined?	•
made on the contamination problem and the new environmental data required to make them	<ul> <li>What impact do the site specific, geologic and hydrogeological conditions have on the fate and transport of any impacts that may be identified?</li> </ul>	
	<ul> <li>Does the level of impact coupled with the fate and transport of identified contaminants represent an unacceptable risk to identified human and/or environmental receptors on or offsite?</li> </ul>	
5	<ul> <li>Does the collected data provide sufficient information to allow the selection and design of an appropriate remedial strategy, if necessary?</li> </ul>	

DQO Steps (NSW DEC, 2006)	Details	Comments
3. Identify Information Inputs (identify inputs to decision) Identify the information needed to support any decision and specify which inputs require new environmental measurements	The main inputs to the environmental investigation works include:  • Identification of historic potential contamination on site (Section 4) and preliminary site inspection (Section 2.5);  • National and NSW EPA guidelines under the NSW Contaminated Land Management Act 1997.  • Investigation sampling to verify the presence of onsite contamination and to evaluate the potential risks to sensitive receptors; and  • At the end of the assessment, a decision must be made regarding whether the soils and groundwater are suitable for the proposed development, or if additional investigation or remedial works are required to make the site suitable.	- The assessment is required to accompany a DA to Council to characterise the condition of site soils and groundwater with respect to the proposed redevelopment of the property; which comprises of a multi-storey residential building, with associated on site car parking, and landscaping area (as discussed in Section 1.2.);  - Historical information indicates the potential for site contamination from various potential sources, as detailed in Section 4.1
4. Define the Boundaries of the Study Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision	<ul> <li>Lateral – the investigation will be conducted within the site boundaries; which defines the extent of the investigation;</li> <li>Vertical – From existing ground surface, underlying fill and natural soil horizons, to the underlying groundwater aquifer; and</li> <li>Temporal – Results are valid on the day of data and sample collection and remain valid as long as no changes occur on site or contamination (if present) does not migrate on site or on to the site from off-site sources.</li> </ul>	Lateral – the extent of the study onsite was limited to accessible areas of the site due to existing building structures, site infrastructure, and areas of site operations, as detailed in <b>Section 7.2</b> .
5. Develop the Analytic Approach (Develop a decision rule)  To define the parameter of interest, specify the action level, and integrate previous DQO outputs into a single statement that describes a logical basis for choosing from alternative actions	The decision rules for the investigation were:  If the concentrations of contaminants in the soil and/or groundwater data exceed the land use criteria; then assess the need to further investigate the extent of impacts on site; and  Decision criteria for QA/QC measures are defined by the Data Quality Indicators (DQI) in  Table 6-2.	

DQO Steps (NSW DEC, 2006)	Details	Comments
6. Specify Performance or Acceptance Criteria (Specify limits on decision errors) Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data	Based on the qualitative data gathered via site history review and site walkover observations, a non-statistical judgemental sampling design was selected for performing a programme of limited sampling for the PSI. As the site investigation area is predominantly involves areas subject to modification or development have been identified as areas of environmental concern (AEC) based identified contamination sources, known contaminants of concern, and professional judgement. Where there is uncertainty regarding the quality of the data obtained via the adoption of the judgemental sampling design, further investigation by systematic sampling will be required. Qualitative assessment of the data set acquired will comprise hypothesis testing by statistical analysis.	Due to the existing site structures a systematic sampling pattern was not achieved in this DSI. As a result, this DSI primarily adopted a targeted sampling pattern, focusing on identified areas of environmental concern. As such, individual soil data points were assessed solely against adopted criteria.
7. Develop the Detailed Plan for Obtaining Data (Optimise the design	Eight (8) soil sampling locations were set using a targeted sampling pattern across the accessible areas of the site to evaluated areas of environmental concern.	
ror optaining data)	An upper soil profile sample (soil extracted immediately beneath the concrete hardstand)	

- assess the conditions of fill layer, and impacts from activities above ground. Further sampling pavement will be collected at each borehole location and tested for chemicals of concern, to would also be carried out at deeper soil layers. These samples would be selected for testing screening in headspace samples) whilst giving consideration to characterise the subsurface based on field observations (including visual and olfactory evidence, as well as soil vapour An upper soil profile sample (soil extracted immediately beneath the concrete hardstand / soil stratigraphy.

sampling and analysis design for general data that are expected to satisfy the Identify the most resource-effective

- Written instructions will be issued to guide field personnel in the required fieldwork activities.

Environmental Investigations Australia Contamination | Remediation | Geotechnical

# 6.2 DATA QUALITY INDICATORS

To ensure that the investigation data collected was of an acceptable quality, the investigation data set was assessed against the data quality indicators (DQI) outlined in **Table 6-2**, which related to both field and laboratory-based procedures. The assessment of data quality is discussed in **Section 8**.

Table 6-2 Data Quality Indicators

QA/QC Measures	Data Quality Indicators
Precision – A quantitative measure of the variability (or reproducibility) of data	Data precision would be assessed by reviewing the performance of blind field duplicate sample sets, through calculation of relative percentage differences (RPD). Data precision would be deemed acceptable if RPDs are found to be less than 30%. RPDs that exceed this range may be considered acceptable where:
	<ul> <li>Results are less than 10 times the limits of reporting (LOR);</li> </ul>
	<ul> <li>Results are less than 20 times the LOR and the RPD is less than 50%; or</li> </ul>
. 10	Heterogeneous materials or volatile compounds are encountered.
Accuracy - A quantitative measure	Data accuracy would be assessed through the analysis of:
of the closeness of reported data to	Method blanks, which are analysed for the analytes targeted in the primary samples;
the "true" value	Matrix spike and matrix spike duplicate sample sets;
	Laboratory control samples; and
an Similas	Calibration of instruments against known standards.
Representativeness - The confidence (expressed qualitatively)	To ensure the data produced by the laboratory is representative of conditions encountered in the field, the laboratory would carry out the following:
that data are representative of each medium present onsite	<ul> <li>Blank samples will be run in parallel with field samples to confirm there are no unacceptable instances of laboratory artefacts;</li> </ul>
	<ul> <li>Review of relative percentage differences (RPD) values for field and laboratory duplicates to provide an indication that the samples are generally homogeneous, with no unacceptable instances of significant sample matrix heterogeneities; and</li> </ul>
	<ul> <li>The appropriateness of collection methodologies, handling, storage and preservation techniques will be assessed to ensure/confirm there was minimal opportunity for sample interference or degradation (i.e. volatile loss during transport due to incorrect preservation / transport methods).</li> </ul>
Completeness – A measure of the amount of useable data from a data	Analytical data sets acquired during the assessment will be evaluated as complete, upon confirmation that:
collection activity	<ul> <li>Standard operating procedures for sampling protocols were adhered to; and</li> </ul>
	<ul> <li>Copies of all COC documentation are presented, reviewed and found to be properly completed.</li> </ul>
and the second	It can therefore be considered whether the proportion of "useable data" generated in the data collection activities is sufficient for the purposes of the land use assessment.
Comparability – The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical	Given that a reported data set can comprise several data sets from separate sampling episodes, issues of comparability between data sets are reduced through adherence to standard operation procedure and regulator-endorsed or published guidelines and standards on each data gathering activity.
event	In addition the data will be collected by experienced samplers and NATA-accredited laboratory methodologies will be employed in all laboratory testing programs.

# ASSESSMENT METHODOLOGY

# 7.1 SAMPLING RATIONALE

With reference to the preliminary CSM described in **Section 5** and the DQO discussed in **Section 6**, the proposed soil and groundwater investigation works were planned in accordance with the following rationale:

- Sampling fill and natural soils from eight borehole locations across accessible areas of the site using a targeted sampling approach to characterise in-situ soils;
- Sampling groundwater during a single groundwater monitoring event (GME) at one newly installed groundwater monitoring wells on-site to assess potential groundwater contamination; and
- Laboratory analysis of representative soil and groundwater samples for the identified chemicals of concern.

# 7.2 INVESTIGATION CONSTRAINTS

With regard to the scope of works proposed for performing intrusive site investigations, the following investigation constraints were encountered:

- A borehole (BH101M) could not reach target depth (6 mBGL) due to auger refusal in the residual soil strata, and
- Access to internal building areas of the site was unavailable at the site at the time of the investigation due
  inability to access internal areas due to limited drilling rig head clearance, limited space within the buildings, and
  current operations being performed with the sites buildings. As such, targeted test borehole locations were
  limited to external areas of the site.

# 7.3 ASSESSMENT CRITERIA

The assessment criteria proposed for this project are outlined in **Table 7-1**. These assessment criteria were selected from available published guidelines that are endorsed by national or state regulatory authorities, with due consideration of the exposure scenario that has been considered for the proposed development (residential with minimal access to soils and recreational), and the likely exposure pathways and identified potential receptors.

Table 7-1 Adopted Investigation Levels for Soil and Groundwater

Environmental Media	Adopted Guidelines	Rationale
Soil	NEPM, 2013	Soil Health-based Investigation Levels (HILs)
	Soil HILs, EILs, HSLs, ESLs & Management	Based on the proposed development plans. El assumed the land use at onsite after redevelopment would meet the definition of HIL-B land use. Samples at BH104 to BH108 therefore are assessed against the NEPM
	Limits for TRHs	2013 HIL-B thresholds for residential sites with minimal opportunities for soil access.
. II		BH101M to BH103 soil samples would meet the definition of HIL-C thresholds for deep soil areas that may be retained on site for landscaping or
		gardening use.
*		Ecological Investigation Levels (EILs) Soil samples from BH101M to BH103 are also assessed against the NEPM 2013 EILs for arsenic, copper, chromium (III), nickel, lead, zinc, DDT and
9		naphthalene which have been derived for protection of terrestrial ecosystems. Table 7-2 provides a summary of adopted Added Contaminant Levels (ACL) and Ambient Background Concentrations for the derivation of
9	a.	copper, chromium (III), nickel, lead, and zinc EILs. Generic EILs were adopted for ecological assessment in relation to arsenic, DDT and
		naphthalene.
		Soil Health-based Screening Levels (HSLs) The NEPM 2013 Soil HSL A&B thresholds for low-high density residential
		sites and HSL C for recreational sites for vapour intrusion would be applied to assess for potential human health impacts from residual vapours resulting
Ti di		from petroleum, BTEX & naphthalene. Soils asbestos results are to be assessed against the NEPM 2013 Soil HSL
		thresholds for "all forms of asbestos".
10		Ecological Screening Levels (ESLs) Soil samples from BH101M, BH102 and BH103 are also assessed against
		the NEPM 2013 ESLs for selected petroleum hydrocarbons fractions, BTEX
		and benzo(a)pyrene for protection of terrestrial ecosystems.
Groundwater	NEPM, 2013 GILs for	Groundwater Investigation Levels (GILs) for Marine Waters
	Fresh Waters and Marine Waters	NEPM 2013 provides GILs for typical, slightly-moderately disturbed aquatic ecosystems, which are based on the ANZECC & ARMCANZ 2000 Trigger
2 mg 2 m	ANZECC 2000 Trigger Values	Values (TVs) for the 95% level of protection of aquatic ecosystems; however the 99% TVs were applied for the bio-accumulative metals cadmium and
_ in 0.0	NEPM, 2013 Groundwater HSLs for Vapour Intrusion	mercury. The nearest potential surface water receptor in relation to the site was identified as Prospect Creek which ultimately discharges to Georges
11.1		River and Botany Bay, which is identified as a Marine Waters system, GILs for Marine Waters are adopted in this limited investigation to assess groundwater quality.
	of the second	Due to the ANZECC (2000) criteria for TRH being below the laboratory limit
V 10 11 11 11	9 48 8	of reporting, the PQL for each TRH fraction was adopted as the GIL for aquatic ecosystems, in accordance with the procedure described in DEC (2007) Guidelines for the Assessment and Management of Groundwater

Environmental Media	Adopted Guidelines	Rationale
		Contamination.
		Health-based Screening Levels (HSLs)
181		The NEPM 2013 groundwater HSLs for vapour intrusion are used to assess potential human health impacts from residual vapours resulting from petroleum, BTEX and naphthalene contamination. HSL A & B thresholds for residential sites and HSL C are applied.

# Table 7-2 Adopted ACL and ABC Values for EIL Derivation

Metal	Assumed Values <sup>1</sup>	EIL (mg/kg) 2
Arsenic	Generic EIL	100
Chromium (III)	ABC - 15 mg/kg (assumes an old NSW high traffic suburb) ACL - 400 mg/kg (assumes clay content ≥ 10 %)	415
Copper	ABC - 30 mg/kg (assumes an old NSW high traffic suburb) ACL - 65 mg/kg (assumes pH 6.0)	95
DDT	Generic EIL	180
Lead	ABC - 160 mg/kg (assumes an old NSW high traffic suburb) ACL - 1,100 mg/kg	1,260
Naphthalene	Generic EIL	170
Nickel	ABC - 5 mg/kg (assumes an old NSW high traffic suburb) ACL - 30 mg/kg (assumes CEC 5)	35
Zinc	ABC - 120 mg/kg (assumes an old NSW high traffic suburb) ACL - 230 mg/kg (assumes pH 6.0 & CEC 5)	350

#### Note:

ACL - added contaminant limit; ACLs for urban residential and public open space were used for this project

ABC - ambient background concentration

The most stringent ACL values were adopted for Chromium (III), Copper, Lead, Nickel and Zinc, as site soil physiochemical properties (i.e. pH, CEC and clay content) were not tested (Ref. NEPM 2013 Schedule B1, Tables 1B(1), 1B(2), 1B(3) and 1B(4) Soil-specific added contaminant limits)

<sup>2</sup> EIL = ABC + ACL, unless Generic EIL is applicable

For the purposes of this investigation, the adopted soil assessment criteria are referred to as the Soil Investigation Levels (SILs), and the adopted groundwater assessment criteria are referred to as the Groundwater Investigation Levels (GILs). SILs and GILs are presented alongside the analytical results in the corresponding laboratory analytical result summary tables, which are discussed in **Section 9**.

# 7.4 SOIL INVESTIGATIONS

The soil investigations conducted at the site are described in **Table 7-3**. Borehole locations are presented in **Figure 2**.

<sup>&</sup>lt;sup>1</sup> Assumed values are based on NEPM 2013 Schedule B5(c) Guideline on Ecological Investigation Levels for Arsenic, Chromium (III), Copper, DDT, Lead, Naphthalene, Nickel & Zinc

Table 7-3 Summary of Soil Investigation Methodology

Activity/Item	Details
Fieldwork	The soil investigation was conducted on 10 December 2015 by an Et environmental engineer.  A total of eight boreholes (BH101 – BH108) were drilled and sampled. Upon completion of the drilling, one groundwater monitoring well was installed at BH101(herein referred to as BH101M).
Drilling Method & Investigation Depth	BH101 – BH108 were drilled with 4WD-mounted hydraulic drilling rig, fitted with 100 mm solid flight augers. Final bore depths ranged between 1.0 mBGL and 5.5 mBGL.
Soil Logging	Soils were classified in the field with respect to lithological characteristics and evaluated on a qualitative basis for odour, visual signs of contamination, and anthropogenic inclusions. Soil classifications and descriptions were based on the Unified Soil Classification System (USCS) and Australian Standard (AS) 4482.1-2005. Borehole logs are presented in <b>Appendix F</b> .
Field Observations (including visual and olfactory signs of potential contamination)	Field observations made during the soil investigation are recorded on the borehole logs. A summary of the observations is provided in <b>Section 9.1.2</b> .
Soil Sampling	Soil samples were collected using a dry grab method with disposable nitrile gloves and placed into laboratory-supplied, acid-washed, solvent-rinsed glass jars. Gloves were replaced between sampling locations.
	Blind field duplicates were separated from the primary samples without mixing and placed into glass jars.
5	A small amount of material was collected from each soil sample and placed into a zip-lock bag as soil headspace samples for Photo-ionisation Detector (PID) screening.
	A small amount of material was separated from all fill samples and placed into a zip-lock bag for asbestos analysis.
Decontamination Procedures	Drilling Equipment – Spoils remained on drilling rods were removed by hand, followed by rinsing with potable water until the rods were free of all residual materials between borehole locations.
	The hand auger was decontaminated with a diluted solution of Decon 90 and potable water, followed by rinsing with potable water until the auger was free of all residual materials.
	Sampling Equipment – Decontamination was not required as the sampling gloves were replaced between sampling locations.
Sample Preservation	Samples were stored in a refrigerated (ice-filled) chest, whilst on-site and in transit to the laboratory All samples were submitted and analysed within the required holding period, as documented in laboratory reports discussed in a later section.
Management of Soil Cuttings	Soil cuttings were used as backfill for completed boreholes. Excess soil cuttings were retained on- site in sealed heavy duty plastic bags.
Quality Control & Laboratory Analysis  A number of soil samples were submitted for analysis of previously identified chemic by SGS Laboratories (SGS). QA/QC testing comprised intra-laboratory duplicates ('fit tested blind by SGS and inter-laboratory field duplicates tested blind by Envirolab Se (Envirolab). All samples were transported under strict Chain-of-Custody (COC) condicertificates and laboratory sample receipt documentation were provided to El for conpurposes, as discussed in Section 8.	
Soil Vapour Screening	Field screening for potential VOCs collected in soil headspace samples was conducted using a PIE fitted with a 10.6 eV lamp.

# 7.5 GROUNDWATER INVESTIGATIONS

The groundwater investigations conducted at the site are described in **Table 7-4**. The location of the monitoring wells is illustrated in **Figure 2**.

Table 7-4 Summary of Groundwater Investigation Methodology

Activity/Item	Details
Fieldwork	The groundwater monitoring well (BH101M) was installed and developed on 10 December 2015.
	Water level gauging, well purging, field testing and groundwater sampling were conducted on 15 December 2015 by an El environmental scientist.
Well Construction	The groundwater monitoring well was installed at approximately 5.5 mBGL. Well construction details are tabulated in <b>Table 9-2</b> and documented in the bore logs presented in <b>Appendix F</b> . BH101M well was installed to screen the clay profile.
	Well construction was in general accordance with the standards described in NUDLC (2012) and comprised the following:
* 10	<ul> <li>50 mm (internal diameter), Class 18 uPVC, threaded, machine-slotted screen and solid casing;</li> </ul>
	<ul> <li>Base and top of each well was sealed with a uPVC cap;</li> <li>Annular, graded sand filter was used to backfill the well annulus from the bottom to minimum 500 mm above the top of screen interval;</li> <li>Minimum 500 mm thick granular bentonite was applied above annular filter in order to seal the screened interval;</li> </ul>
x g (this is a	Drill cuttings were used to backfill the bore annulus to just below ground level; and
ed i.e.	<ul> <li>Surface completion comprised a steel road box cover finished flush with the concrete slab level.</li> </ul>
Well Development	Well development was conducted after well installation. This involved agitation within the full length of the water column using a HDPE, disposable bailer, followed by removal of groundwater by the same bailer. Bailers were replaced between groundwater wells. Groundwater removal was continued until the monitoring wells were purged dry, or until further decrease in groundwater turbidity was not observed.
Well Gauging	All monitoring wells were gauged for standing water level (SWL, depth from ground level to groundwater) prior to well purging at the commencement of the GME on 15 December 2015. The gauging was conducted with an oil-water interface probe to assess for potential presence of phase-separated hydrocarbon (PSH). The measured SWLs are shown in Table 9-3.
Well Purging, Field Testing and Groundwater Sampling	The groundwater monitoring well was purged and sampled using low-flow/minimal drawdown sampling method with a MicroPurge kit (MP15) and a portable MicroPurge pump following well gauging.
	The MicroPurge system incorporates a low density poly-ethylene (LDPE) pump bladder, and a Teflon-lined LDPE sample delivery tube. The system used for this investigation employed pressurised carbon dioxide gas to regulate groundwater flow. Pump pressure and pumping cycles were adjusted accordingly to regulate extraction flow rate, and to avoid causing excessive drawdown of water level during the sampling process.
	Field measurement of water quality parameters was conducted continuously on purged groundwater with a water quality meter (Hanna Multi Parameter 9829) positioned within an open flow-through cell. Groundwater parameters tested in the field were Dissolved Oxygen (DO), Electrical Conductivity (EC), Redox, Temperature and pH. The measured parameters were recorded onto a field data sheet (Appendix G), along with the purged water volume at the time of measurement.
	Groundwater sampling was performed when three consecutive readings of groundwater

	_
Activity/	l4ama
ALLIVIIV/	ILEIII

#### Details

parameter indicated stabilisation; as per the specified ranges detailed below:

- Electrical Conductivity: ± 3% of the read value;
- Redox: ± 20 mV;
- DO: ± 20% of the read value; and
- pH: ± 0.2 pH unit.

Total water volume purged and stabilised groundwater parameters at each groundwater monitoring well are summarised in **Table 9-3**.

#### Sample Preservation

The following sample containers supplied by the laboratory were used to store groundwater samples:

- One, amber glass, acid-washed and solvent-rinsed bottle;
- Two, 40 ml amber glass vials, pre-preserved with dilute hydrochloric acid, Teflon-sealed;
- One, 250 mL, HDPE bottle, pre-preserved with dilute nitric acid (1 mL).

Samples collected for heavy metal analysis were field-filtered using 0.45  $\mu m$  pore-size filters. All containers were filled with sample to the brim then capped and stored in ice-filled chests, until completion of the fieldwork and during sample transit to the laboratory.

#### Quality Control & Laboratory Analysis

All groundwater samples were submitted for analysis of previously-identified chemicals of concern by SGS Laboratories (SGS). QA/QC testing comprised testing of rinsate blank and trip blank samples. All samples were transported under strict Chain-of-Custody (COC) conditions. COC certificates and laboratory sample receipt documentation were provided to El for confirmation purposes.

#### Sample Transport

After sampling, refrigerated sample chests were transported to SGS Australia Pty Ltd using strict Chain-of-Custody (COC) procedures. A Sample Receipt Advice (SRA) was provided by the laboratory to document sample condition upon receipt. Copies of SRA and COC certificates are presented in **Appendix H**.

#### 8. DATA QUALITY ASSESSMENT

The assessment of data quality is defined as the scientific and statistical evaluation of environmental data to determine if these data meet the objectives of the project (US EPA, 2006). Data quality assessment includes an evaluation of the compliance of the field sampling and laboratory analytical procedures and an assessment of the accuracy and precision of these data from the laboratory quality control measurements obtained.

The data quality assessment process for this assessment included a review of analytical procedures to confirm compliance with established laboratory protocols and an assessment of the accuracy and precision of analytical data from a range of quality control measurements. The QC measures generated from the field sampling and analytical program were as follows:

- Suitable records of fieldwork observations including borehole logs;
- Relevant and appropriate sampling plan (density, type, and location);
- Use of approved and appropriate sampling methods;
- Preservation and storage of samples upon collection and during transport to the laboratory;
- Complete field and analytical laboratory sample COC procedures and documentation;
- Sample holding times within acceptable limits;
- Use of appropriate analytical procedures and NATA-accredited laboratories; and
- Required LOR (to allow for comparison with adopted investigation levels);
- Frequency of conducting quality control measurements;
- Laboratory blanks;
- Field duplicates;
- Laboratory duplicates;
- Matrix spike/matrix spike duplicates (MS/MSDs);
- Surrogates (or System Monitoring Compounds);
- Analytical results for replicated samples, including field and laboratory duplicates and inter-laboratory duplicates, expressed as Relative Percentage Difference (RPD); and
- Checking for the occurrence of apparently unusual or anomalous results, e.g. laboratory results that appear to be inconsistent with field observations or measurements.

The findings of the data quality assessment in relation to the soil and groundwater investigations at the site are discussed in detail in **Appendix J**. QA/QC policies and DQOs are presented in **Appendix K**.

On the basis of the analytical data validation procedure employed the overall quality of soil analytical data produced for the site were considered to be of an acceptable standard for interpretive use.

#### 9. RESULTS

#### 9.1 SOIL INVESTIGATION RESULTS

### 9.1.1 Site Geology and Subsurface Conditions

The general site geology encountered during the soil investigation is described as a layer of anthropogenic filling overlying residual clayey soils and shale. The geological information obtained during the investigation is summarised in **Table 9-1** with borehole logs presented in **Appendix F**.

Table 9-1 Generalised Subsurface Profile

Layer	Description	Depth to Top & Bottom of Layer (mBGL)	
		Тор	Bottom
Fill	Fill material generally comprised clay medium to high plasticity dark brown, dark grey with occasional inclusions of gravel.	0.1 m	0.3 – 0.5
Natural clay	CLAY, medium to high plasticity, generally brown and orange and grey.	0.3 – 0.5	0.8 – 2.3
Shale	Shale Extremely weathered, light brown.	0.8 – 2.3	1.5 – 5.5

#### Notes:

#### 9.1.2 Field Observations and PID Results

Soil samples were obtained from the drilled boreholes at various depths ranging between 0.1 m to 1.5 mBGL. Examined soil samples were evaluated on a qualitative basis for odour and visual signs of contamination (e.g. hydrocarbon odours, oil staining, petrochemical filming, asbestos fragments, ash, charcoal, etc.) and the following observations were noted:

- Olfactory evidence of hydrocarbon contamination was not noted during drilling or in samples collected;
- Foreign objects of anthropogenic origin were not observed;
- · Fibrous cement sheeting was not observed in any of the sampling locations; and
- Soil headspace samples were field-screened using a portable PID, with concentrations recorded onto bore logs. The PID headspace readings of samples ranged between 3.0 ppm and 7.1 ppm. Recorded PID readings are reported on borehole logs, presented in Appendix C.

<sup>+</sup> Termination depth of borehole. Detailed descriptions of materials encountered at each borehole are provided in the borehole logs included as **Appendix F**.

#### 9.2 GROUNDWATER INVESTIGATION RESULTS

#### 9.2.1 Monitoring Well Construction

One groundwater monitoring well was installed at BH101M upon completion of drilling. The well installation depth and screen interval are summarised in **Table 9-2**. Further construction details are discussed in **Table 7-4**, whilst graphical representation of the monitoring well is shown in the borehole log included as **Appendix F**.

Table 9-2 Monitoring Well Construction Details

Well ID	Well Depth (n	nBGL)	Screen Inte	rval (mBGL)	Lithology	Screened	
BH101M	5.5		2.3 – 5.3		Shale		

Notes:

mBGL - Metres below ground level.

### 9.2.2 Field Observations and Water Test Results

A GME was conducted on 15 December 2015. Standing water levels (SWL) were measured within the groundwater monitoring well prior to well purging. SWL, well purge volumes prior to sample collection, and field test results of groundwater quality parameters at the monitoring well location were recorded onto the field data sheet. A summary of the recorded field data is presented in **Table 9-3** with copies of completed field data sheets included in **Appendix G** 

Table 9-3 Groundwater Field Data

Well ID	SWL	Stickup	WL <sup>†</sup>	Purge	DO*	Field	Field EC	Temp	Redox	Odours /
	(mBTOC)	(m)	(mBGL)	Volume (L)	(ppm)	pH	(µS/cm)	(°C)	(mV)	Turbidity
	3.75	-0.10		0.5	0.86	7.20	9256	23.3	190.9	Light brown / yellow, moderate turbidity, no sheen no odour.

#### Notes:

SWL - Standing Water Levels as measured from TOC (top of well casing) prior to groundwater sampling.

mBTOC - Metres below top of well casing.

Stickup – Measured distance between ground level to TOC. Negative number indicated TOC is lower than ground level.

† WL - Groundwater level reduced to metres above the Australian Height Datum. WLs were calculated as WL = Reduce Ground Level - (SWL + Stickup).

L - litres (referring to the volume of water purged from the well prior to groundwater sample collection).

DO - Dissolved Oxygen in units of parts per million.

EC - Groundwater electrical conductivity as measured onsite using portable EC meter.

μS/cm - Micro Siemens per centimetre (EC units).

Redox - Oxidation and reduction potential. Redox reported in Table 9-3 has been adjusted relative to standard hydrogen electrode (by adding 205 mV to field reading, as advised by the test equipment manufacturer). Refer to **Appendix G** for field redox readings pre-adjustment.

mV - Millivolts:

All groundwater parameters (pH, Redox, EC and DO) were tested on site:

The field pH data indicated that the groundwater pH was neutral. Electrical conductivity (EC) measurements was reported at 9256 µS/cm, suggesting groundwater was marginally fresh to slightly brackish in terms of water salinity. Redox measurement was reported at 190.9 mV, suggesting groundwater encountered in the GME was oxidising.

#### 9.3 LABORATORY ANALYTICAL RESULTS

#### 9.3.1 Soil Analytical Results

A summary of laboratory results showing test sample quantities and samples found to exceed the SILs, is presented in **Table 9-4**. Detailed tabulations of results, comparing the concentrations of individual samples with adopted soil criteria, are presented in **Table T1** and **T3** at the end of this report. Elevated concentrations, along with the respective sampling locations are also indicated on **Figure 3**. Completed documentation used to track soil sample movements and laboratory receipt (i.e. COC and SRA forms) are copied in **Appendix H**, with laboratory analytical reports for tested soil samples are presented in **Appendix I**.

Table 9-4 Summary of Soil Analytical Results

No. of Primary samples	Analyte	Sample and Concentration exceeding SIL
Heavy Metal	***************************************	
12	Arsenic	None
12	Cadmium	None
12	Chromium (Total)	None
12	Copper	None
12	Lead	Sample at threshold for HSL B
12	Mercury	None
12	Nickel	None
12	Zinc	None
Hydrocarbons		
12	TRH F1 (C <sub>6</sub> -C <sub>10</sub> minus BTEX)	None
12	TRH F2 (>C <sub>10</sub> -C <sub>16</sub> minus naphthalene)	None
12	TRH F3 (>C <sub>16</sub> -C <sub>34</sub> )	None
12	TRH F4 (>C <sub>34</sub> -C <sub>40</sub> )	None
12	Benzene	None
12	Toluene	None
12	Ethyl benzene	None
12	Total xylenes	None
PAHs		
12	Carcinogenic PAHs (as B(a)P TEQ)	None
12	Benzo(a)pyrene	None
12	Total PAHs	None

OPPs		
8	OPP compounds	None
PCBs		
8	Total PCBs	None
Asbestos		
12	Asbestos	None

#### 9.3.2 Groundwater Analytical Results

A summary of laboratory results showing test sample quantities and samples found to exceed the GILs, is presented in **Table 9-5**. Laboratory analytical results for groundwater samples are summarised in **Tables T4**, which also include the adopted GILs. Completed documentation used to track groundwater sample movements and laboratory receipt

(COC and SRA forms) are copied in **Appendix H**. Copies of the laboratory analytical reports are attached in **Appendix I**.

 Table 9-5
 Summary of Groundwater Analytical Results

No. of primary samples	Analyte	Exceedances of GIL and reported concentration
Heavy Metal	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	
1	Arsenic	None
1	Cadmium	None
1	Chromium (Total)	None
1	Copper	None
1	Lead	None
1	Mercury	None
1	Nickel	None
1	Zinc	None
Hydrocarbons	mat	
1	F1 TRH (C <sub>6</sub> -C <sub>10</sub> minus BTEX)	None
1	F2 TRH (>C <sub>10</sub> -C <sub>16</sub> minus naphthalene)	None

PAHs		×
1	Total PAHs	None

#### 10. SITE CHARACTERISATION DISCUSSION

#### 10.1 HEAVY METALS IN SOILS

Concentration of Lead (Pb) at the threshold of the adopted HIL criteria was reported in sample BH108\_0.13-0.23 (1,200 mg/kg). On review of the development plans for the proposed development this sampling location lies within the area of the proposed extent of the basement and can be managed during the bulk excavation of the basement. Results of tested natural material underlying Lead impacted fill soil were reported well within the adopted criterion indicating that the impacted lead soils had not leached to the natural material.

#### 10.2 ASBESTOS RISKS

Given the limitations associated with identification of asbestos via an intrusive investigation utilising boreholes, a visual inspection should be performed after demolition of site structures and removal of the existing surface cover.

A Hazardous Materials Survey (HMS) should also be undertaken prior to site demolition by a suitably qualified person. This should be performed to identify ACM and other potentially hazardous building products, and to enable the development and implementation of appropriate management procedures during demolition (if necessary).

#### 10.3 GROUNDWATER CHARACTERISATION

Due to the installation of only one (1) groundwater monitoring well during the investigation, determination of groundwater flow direction and background groundwater quality could not be established. Elevated concentrations in excess of the adopted GILs were not reported in groundwater sample 101M.

#### 10.4 REVISED CONCEPTUAL SITE MODEL - POST-FIELD INVESTIGATION

The preliminary CSM discussed in **Section 5** was considered appropriate to identify contamination sources, migration mechanisms and exposure pathways, as well as potential onsite and offsite receptors, on the basis of the findings from this investigation. Several previously known data gaps, as outlined in **Section 5**, have been addressed, however, the following remaining data gap needs to be addressed in subsequent investigation works:

Potential presence of hazardous materials present within the existing structures.

#### 10.4.1 Data Gaps

The following remaining data gaps need to be assessed in subsequent investigation works:

Potential presence of hazardous materials present within site structures.

#### 11. CONCLUSIONS

The property identified as 47 Woodville Road, Chester Hill NSW, was the subject of a Detailed Site Investigation in order to assess for on-site contamination associated with the identified current and former land uses. Based on the findings of this assessment it was summarised that:

- At the time of the site walkover the site was in use and occupied by AUS Mate a car sales and rentals depot and car wash facility;
- Total site area was approximately 2,284 m<sup>2</sup>. Land use on surrounding lands was predominantly commercial and residential;
- Review of land title records and historical aerial photographs suggested that use of the site was primarily
  agricultural until the early 1950's when it was redeveloped for commercial uses. An Internet search for the
  business name "Leafvale Holdings Pty Ltd' owner of the site from 1985 to 2015 identified the proprietor as a
  motor vehicle dealership.
- A search of WorkCover NSW Authority records relating to the site was requested by El. Correspondence dated 11 and 16 December 2015 (*Ref: D15/203188*) indicate indicated a search of the Stored Chemical Information Database and the microfiche records held by WorkCover NSW did not locate any records relating to the site. Copies of the correspondences are provided in **Appendix E**.
- A search through the record of notices for contaminated land indicated that the site and lands in its vicinity (<</li>
   100 m) were free of statutory notices issued by the NSW EPA/OEH, and were not identified on the List of NSW contaminated sites notified to the EPA, or the POEO public register.
- Site walkover inspection did not identify the presence of underground petroleum storage systems (UPSS).
- Soil investigation was conducted at eight borehole locations (BH101M BH108) across accessible areas of
  the site to a maximum depth of 5.5 mBGL, with soil samples for environmental assessment purposes
  collected down to approximately 2.4 mBGL. A groundwater monitoring well was installed at one location upon
  completion of drilling, denoted as BH101M;
- The general site geology encountered during the soil investigation is described as a layer of anthropogenic filling overlying clayey soils and shale.
- Laboratory analytical results of tested soil samples were assessed against the health-based investigation level for residential sites with minimal access to soil (HIL-B) and recreational soil (HIL-C). The analytical results suggested the following:
  - Concentration of Lead (Pb) at the threshold of the adopted HIL criteria was reported in sample BH108\_0.13-0.23 (1,200 mg/kg). On review of the development plans for the proposed development this sampling location lies within the area of the proposed extent of the basement and can be managed during the bulk excavation. Results of tested natural material underlying Lead impacted fill soil were reported well within the adopted criterion indicating that the impacted lead soils had not leached to the natural material.

- Free fibres and fragmented asbestos-containing material (ACM) was not identified in examined soils during field investigation.
- Due to the installation of only one (1) groundwater monitoring well during the investigation, determination of groundwater flow direction and background groundwater quality could not be established. Elevated concentrations in excess of the adopted GILs were not reported in groundwater sample 101M.
- The following data gaps identified in this DSI will require closure by further investigations:
  - Potential presence of hazardous materials present within site structures.

Based on the findings of the DSI and with consideration of the Statement of Limitations (Section 13), El concludes that widespread contamination was not identified and the site is considered suitable for the proposed residential development provided the following recommendations, outlined in Section 12, are implemented.

### 12. RECOMMENDATIONS

Based on the findings of this investigation, the following recommendations are provided:

- Prior to site demolition, carry out a Hazardous Materials Survey on existing site structures to identify
  potentially hazardous building products that may be released to the environment during demolition;
- Any material being removed from site (including virgin excavated natural materials (VENM)) should be classified for off-site disposal in accordance the EPA (2014) Waste Classification Guidelines; and
- Any material being imported to the site should be assessed for potential contamination in accordance with NSW EPA guidelines as being suitable for the intended use or be classified as VENM.

#### 13. STATEMENT OF LIMITATIONS

This report has been prepared for the exclusive use of Baraz Construction Pty Ltd who is the only intended beneficiary of El's work. The scope of the investigations carried out for the purpose of this report is limited to those agreed with Baraz Construction Pty Ltd on 4 December 2015.

No other party should rely on the document without the prior written consent of EI, and EI undertakes no duty, or accepts any responsibility or liability, to any third party who purports to rely upon this document without EI's approval.

El has used a degree of care and skill ordinarily exercised in similar investigations by reputable members of the environmental industry in Australia as at the date of this document. No other warranty, expressed or implied, is made or intended. Each section of this report must be read in conjunction with the whole of this report, including its appendices and attachments.

The conclusions presented in this report are based on a limited investigation of conditions, with specific sampling locations chosen to be as representative as possible under the given circumstances.

El's professional opinions are reasonable and based on its professional judgment, experience, training and results from analytical data. El may also have relied upon information provided by the Client and other third parties to prepare this document, some of which may not have been verified by El.

El's professional opinions contained in this document are subject to modification if additional information is obtained through further investigation, observations, or validation testing and analysis during remedial activities. In some cases, further testing and analysis may be required, which may result in a further report with different conclusions.

Notes:

GIL (Marine Waters) HSL A & B

All results and criteria are in µg/L, unless otherwise noted

Highlighted values indicate concentrations exceed the adopted GIL.

NEPM 2013 Schedule B1\_Groundwater investigation level for marine waters ecosystem

Health screening level for residential sites, as per Table 1A(4) of NEPIM 2013 Schedule B1, As soils encountered during field investigation comprised primarity clayey materials. HSL for clay was adopted. HSL are applied

based on the estimated source depth of groundwater at each monitoring well.

Not Limited (Ref. NEPM 2013, Schedule B1, Table 1(A)4)

No recommended assessment criteria are currently available for the indicated parameter(s)

(Laboratory's ) Practical Quantitation Limit

R R S

F1 = TRH C6-C10 less BTEX

F2 = TRH > C10-C16 less Naphthalene

F3 = TRH > C16-C34

: 1 I

F4 = TRH > C34 - C40

ANZECC (2000) provides 7 µg/L as an assessment guideline for total petroleum hydrocarbons. Since the laboratory practical quantifation limits (PQL) is higher than the ANZECC guideline, the PQL has been adopted as the interim GIL, as prescribed in DEC (2007)

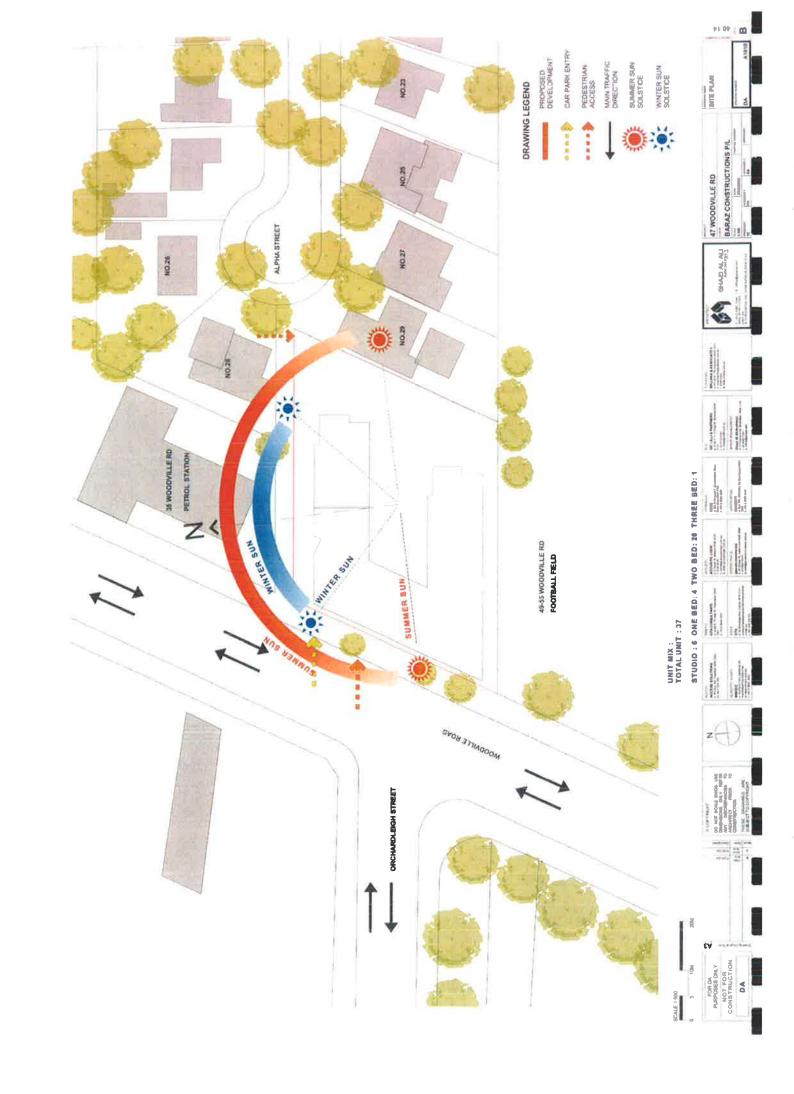

The 99% Trigger Values were adopted for this assessment. Ref. ANZECC & ARMCANZ (2000).

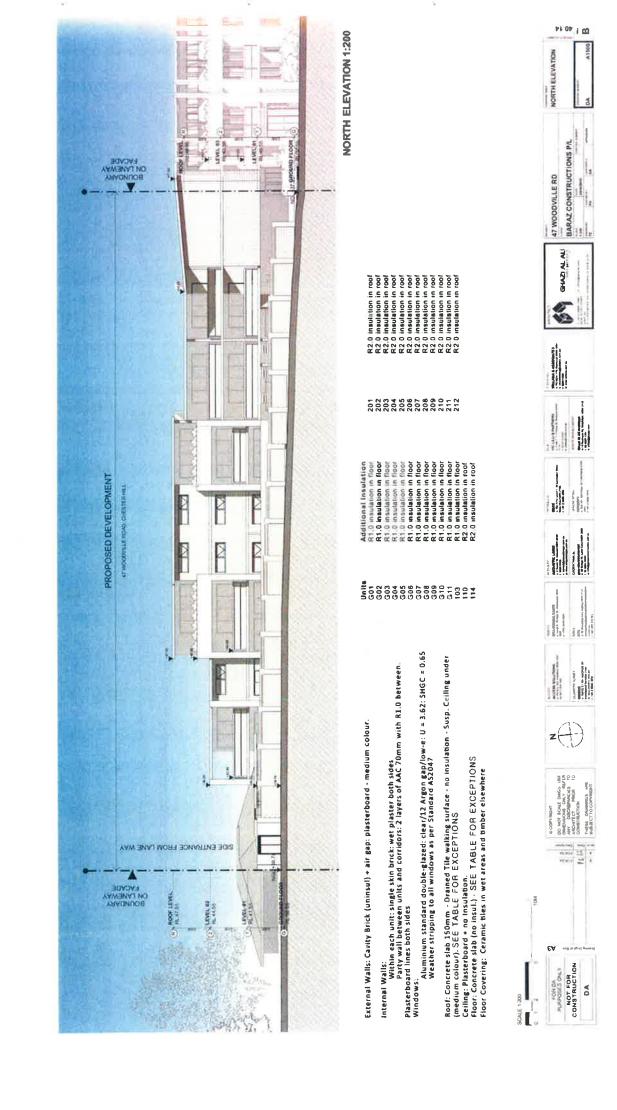

Indicated threshold value may not protect key species from chronic toxicity. Ref. ANZECC & ARMCANZ (2000).

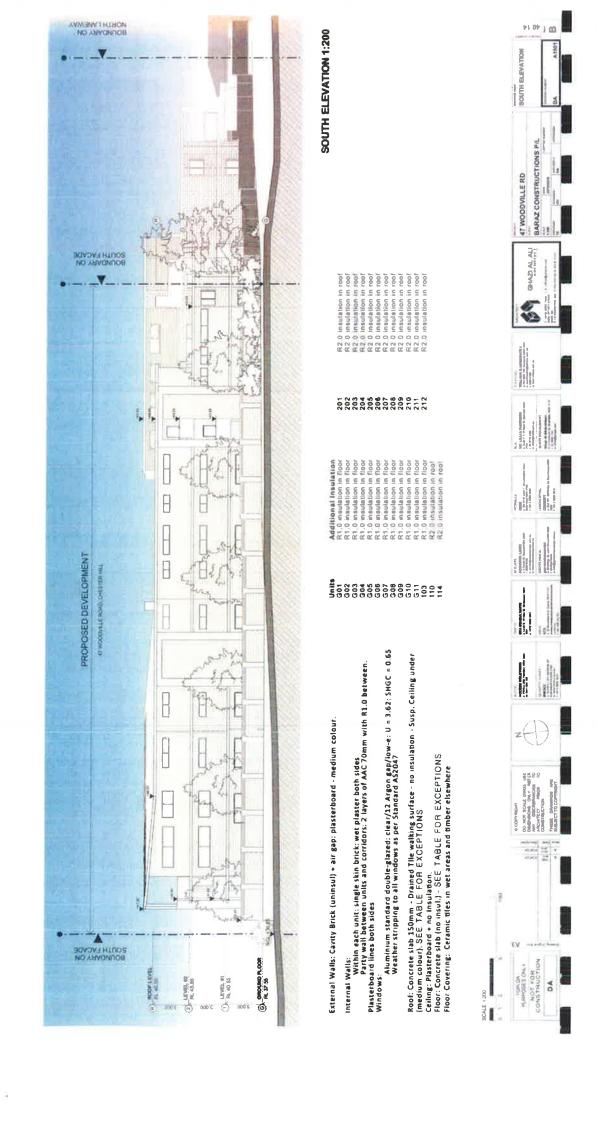

Low reliability 95% trigger values were adopted. Ref. Section 8.3.7, ANZECC & ARMCANZ (2000)

#### **METHOD SUMMARY**

	×
METHOD	METHODOLOGY SUMMARY
AN002	The test is carried out by drying (at either 40°C or 105°C) a known mass of sample in a weighed evaporating basin. After fully dry the sample is re-weighed. Samples such as sludge and sediment having high percentages of moisture will take some time in a drying oven for complete removal of water.
AN020	Unpreserved water sample is filtered through a 0.45µm membrane filter and acidified with nitric acid similar to APHA3030B.
AN040/AN320	A portion of sample is digested with nitric acid to decompose organic matter and hydrochloric acid to complete the digestion of metals. The digest is then analysed by ICP OES with metals results reported on the dried sample basis. Based on USEPA method 200.8 and 6010C.
AN040	A portion of sample is digested with Nitric acid to decompose organic matter and Hydrochloric acid to complete the digestion of metals and then filtered for analysis by ASS or ICP as per USEPA Method 200.8.
AN311/AN312	Mercury by Cold Vapour AAS in Waters: Mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500.
AN312	Mercury by Cold Vapour AAS in Soils: After digestion with nitric acid, hydrogen peroxide and hydrochloric acid, mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500
AN318	Determination of elements at trace level in waters by ICP-MS technique, in accordance with USEPA 6020A.
AN400	OC and OP Pesticides by GC-ECD: The determination of organochlorine (OC) and organophosphorus (OP) pesticides and polychlorinated biphenyls (PCBs) in soils, sludges and groundwater. (Based on USEPA methods 3510, 3550, 8140 and 8080.)
AN403	Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four
* 5 % 5	alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36 and in recognition of the NEPM 1999 (2013), >C10-C16 (F2), >C16-C34 (F3) and >C34-C40 (F4). F2 is reported directly and also corrected by subtracting Naphthalene (from VOC method AN433) where available.
AN403	Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Petroleum Hydrocarbons (TPH) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with differential polarity of the eluent solvents.
AN403	The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol, if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependent on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.
AN420	(SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols (etc) in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).
AN420	SVOC Compounds: Semi-Volatile Organic Compounds (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).
AN433/AN434/AN410	VOCs and C6-C9/C6-C10 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.
AN433/AN434	VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.
AN602	Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM) in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal identification of the asbestos minerals present is made by obtaining sufficient diagnostic 'clues', which provide a reasonable degree of certainty, dispersion staining is a mandatory 'clue' for positive identification. If sufficient 'clues' are absent, then positive identification of asbestos is not possible. This procedure requires removal of suspect fibres/bundles from the sample which cannot be returned.
AN602	Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf).

#### **METHOD SUMMARY**

AN602

AN602

AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples, Section 8.4, Trace Analysis Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."

The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01% w/w) where AN602 section 4.5 of this method has been followed, and if-

- no trace asbestos fibres have been detected (i.e. no 'respirable' fibres): (a)
- the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in (b) asbestos-containing materials are found to be less than 0.1g/kg: and
- these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.

#### FOOTNOTES :

NATA accreditation does not cover

the performance of this service. Indicative data, theoretical holding time exceeded.

NVL

15

Not analysed.

Not validated.

Insufficient sample for analysis.

LNR Sample listed, but not received. UOM LOR 11

Unit of Measure.

Limit of Reporting.

Raised/lowered Limit of

Reporting.

Samples analysed as received. Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calcuated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf

METHOD -

#### **METHOD SUMMARY**

METHODOLOGY SUMMARY AN602 Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM) in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal identification of the asbestos minerals present is made by obtaining sufficient diagnostic 'clues', which provide a reasonable degree of certainty, dispersion staining is a mandatory 'clue' for positive identification. If sufficient 'clues' are absent, then positive identification of asbestos is not possible. This procedure requires removal of suspect fibres/bundles from the sample which cannot be returned. AN602 Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf). AN602 AS4964,2004 Method for the Qualitative Identification of Asbestos in Bulk Samples Section 8.4. Trace Analysis Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg." AN602 The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01%w/w) where AN602 section 4.5 of this method has been followed, and ifno trace asbestos fibres have been detected (i.e. no 'respirable' fibres): the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in asbestos-containing materials are found to be less than 0.1g/kg; and these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.

#### FOOTNOTES -

Amosite Brown Asbestos NA Not Analysed Chrysotile White Asbestos LNR Listed, Not Required

Crocidolite Blue Asbestos NATA accreditation does not cover the performance of this service.

**Amphiboles** Amosite and/or Crocidolite Indicative data, theoretical holding time exceeded.

(In reference to soil samples only) This report does not comply with the analytical reporting recommendations in the Western Australian Department of Health Guidelines for the Assessment and Remediation and Management of Asbestos Contaminated sites in Western Australia - May 2009.

#### Sampled by the client.

Where reported: 'Asbestos Detected': Asbestos detected by polarised light microscopy, including dispersion staining.

Where reported: 'No Asbestos Found': No Asbestos Found by polarised light microscopy, including dispersion staining.

Where reported: 'UMF Detected': Mineral fibres of unknown type detected by polarised light microscopy, including dispersion staining. Confirmation by another independent analytical technique may be necessary.

Even after disintegration it can be very difficult, or impossible, to detect the presence of asbestos in some asbestos containing bulk materials using polarised light microscopy. This is due to the low grade or small length or diameter of asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID.
	F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Metals-020 ICP- AES	Determination of various metals by ICP-AES.
Metals-021 CV- AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.

#### **Quality Control Definitions**

**Blank**: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

**Duplicate**: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

**Matrix Spike**: A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample): This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

**Surrogate Spike:** Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

#### **Laboratory Acceptance Criteria**

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

#### **METHOD SUMMARY**

SE147247 R0

- METHOD -METHODOLOGY SUMMARY AN020 Unpreserved water sample is filtered through a 0.45µm membrane filter and acidified with nitric acid similar to APHA3030B. AN289 Analysis of Total Phenols in Soil Sediment and Water. Steam distillable phenols react with 4-aminoantipyrine at pH potassium ferricyanide to form a coloured antipyrine dye analysed by Discrete 7.9±0.1 in the presence of Analyser. Reference APHA 5530 B/D. AN311/AN312 Mercury by Cold Vapour AAS in Waters: Mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500. **AN318** Determination of elements at trace level in waters by ICP-MS technique, in accordance with USEPA 6020A. AN403 Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36 and in recognition of the NEPM 1999 (2013), >C10-C16 (F2), >C16-C34 (F3) and >C34-C40 (F4). F2 is not corrected for Naphthalene. AN403 Additionally, the volatile C6-C9/C6-C10 fractions may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Petroleum Hydrocarbons (TPH) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with differential polarity of the eluent solvents. AN403 The GC/FID method is not well suited to the analysis of refined high boiling point materials (le lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependent on the use of specific cleanup fractionation techniques. Reference USEPA 3510B, AN420 (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols (etc) in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D). VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented AN433/AN434/AN410 to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260. AN433/AN434 VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.

FOOTNOTES:

NATA accreditation does not cover

the performance of this service. Indicative data, theoretical holding

time exceeded.

Not analysed. NVL Not validated.

IS Insufficient sample for analysis. LNR Sample listed, but not received. MOU LOR 11

Unit of Measure. Limit of Reporting.

Raised/lowered Limit of Reporting.

Samples analysed as received. Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calcuated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf

# APPENDIX J QA/QC Assessment

# J1 QUALITY CONTROL PROGRAM

# J1.1 INTRODUCTION

For the purpose of assessing the quality of data presented in this DSI report, EI collected field QC samples for analysis. The primary laboratory, SGS Australia Pty Ltd (SGS) and secondary laboratory, Envirolab Services Pty Ltd (Envirolab) also prepared and analysed QC samples. Details of the field and laboratory QC samples are provided, with the allowable acceptance ranges for the data presented in **Table J-1**.

Table J-13-1 Sampling Data Quality Indicators

<b>Data Quality Objective</b>	Data Quality Indicator	Acceptable Range
Accuracy	Field - Trip blank	< laboratory limit of reporting (LOR)
,	Field – Rinsate blank	< laboratory limit of reporting (LOR)
	Laboratory - Laboratory control spike and matrix spike	Prescribed by the laboratories
Precision	Field – Blind replicate and spilt duplicate	< 30 % relative percentage difference (RPD [%])
	Laboratory – Laboratory duplicate and matrix spike duplicate	Prescribed by the laboratories
Representativeness	Field – Trip blank	< laboratory limit of reporting (LOR)
	Field – Trip spike	70% - 130% recovery
	Field - Rinsate blank	< laboratory limit of reporting (LOR)
E 91 S1	Laboratory – Method blank	Prescribed by the laboratories
Completeness	Completion (%)	

# J1.2 CALCULATION OF RELATIVE PERCENTAGE DIFFERENCE (RPD)

The RPD values were calculated using the following equation:

RPD = 
$$\frac{([C_O - C_R] \times 100)}{(C_O + C_R)}$$

Co = Concentration obtained from the primary sample.

C<sub>R</sub> = Concentration obtained from the blind replicate or split sample.

# J2 FIELD QA/QC DATA EVALUATION

The field quality assurance/quality control (QA/QC) samples collected during the investigation works were as follows:

- Blind field duplicate;
- · Inter laboratory duplicate;
- Trip blank;
- · Trip spike; and
- Rinsate blank.

The results of the QA/QC samples collected during the soil investigation and groundwater investigation, including the calculated RPD values between primary and duplicate samples, are presented in **Table J-2** and **Table J-3**, respectively.

## J2.1 SOIL INVESTIGATION

## J2.1.1 Blind Field Duplicate (BFD)

One blind field duplicate sample (QD1) was collected from the primary sample BH105\_0.1-0.2 during the soil investigation. The preparation of the duplicate samples involved the collection of a bulk quantity of soil from the same sampling point without mixing, before dividing the material into identical sampling vessels. The duplicate sample was then presented blind to the primary laboratory (SGS) to avoid any potential analytical bias. The BFD was analysed for TRH, BTEX and selected heavy metals. The RPD values calculated were found to be within the Data Acceptance Criteria (Appendix K, Table QC5).

# J2.1.2 Inter Laboratory Duplicate (ILD)

One inter-laboratory duplicate samples (QT1), collected from the primary sample BH105\_0.1-0.2 was assigned for laboratory analyses. The preparation of the ILD sample was identical to the BFD sample as described above and analysed for TRH, BTEX and selected heavy metals. The RPD values calculated for the ILD sample was found to be within the Data Acceptance Criteria.

#### J2.1.3 Trip Blank

One trip blank (TB1) sample, prepared by the primary laboratory, was analysed for BTEX by the primary laboratory. The soil TB sample results were reported below the laboratory LOR, confirming the Data Acceptance Criteria.

#### J2.1.4 Rinsate Blank

One rinsate blank (QR1) was submitted to the primary laboratory for TRH, BTEX and selected heavy metals analyses. The QR1 sample results were reported below the laboratory LOR.

# J2.2 GROUNDWATER INVESTIGATION

## J2.2.1 Blind Field Duplicate (BFD)

One blind field duplicate sample (QWQD1) was collected from the primary sample BH101M. The preparation of the duplicate sample involved the decanting of the groundwater collected from the respective groundwater monitoring well into

Detailed Site Investigation 47 Woodville Road, Chester Hill NSW Report No. E22827 AA\_Rev0

two separate groups of appropriately labelled sampling containers. Volumes were split equally between the groups of sampling bottles such that the sample contained in each individual bottle, contained a similar proportion of each water volume. It should be noted that the sample was not mixed prior to decanting, in order to preserve the concentrations of volatiles potentially present within the sample. The duplicate sample was then presented blind to the primary laboratory (SGS) to avoid any potential analytical bias. The sample was analysed for TRH, BTEX and selected heavy metals. The RPD values calculated for the analytes tested were found to be within the Data Acceptance Criteria (DAC) with the exception of Nickel and Zinc. The elevated RPDs were considered a result of presence of sediments in groundwater samples, as reflected in the medium groundwater turbidity observed during purging and sampling.

## J2.2.2 Trip Blank

One trip blank sample (GWQTB1), prepared with de-ionised water supplied by the primary laboratory, was analysed for BTEX by the primary laboratory. The GWQTB1 sample results were reported below the laboratory LOR, suggesting the sample transportation and storage procedure was satisfactory.

# J2.2.3 Trip Spike

One trip spike (GWQTS1) sample, prepared by the primary laboratory, was analysed for BTEX by the primary laboratory. The soil TS sample results were reported between the Data Acceptance Criteria.

# J2.3 Assessment of Field QA/QC Data

All soil samples were classified in the field with respect to soil/fill characteristics and any observable signs of contamination based on visual and odour assessment. Furthermore, soil samples were placed immediately into jars following sampling to reduce the loss of volatiles from samples. Results of soil sampling indicated that the samples collected were representative of the soils present at respective sampling locations; therefore, El conclude that the samples collected are representative of the soils present at the respective sampling locations.

All samples, including field QC samples, were transported to the primary and secondary laboratories under strict Chain-of-Custody conditions and appropriate copies of relevant documentation were included in the respective reports.

The overall completeness of documentation produced under the field program of the subject assessment was considered to be adequate for the purposes of drawing valid conclusions regarding the environmental condition of the site.

Based on the results of the field QA/QC data, EI considered the field QA/QC programme carried out during the investigation works to be appropriate and the results to be acceptable.

# J3 LABORATORY QA/QC

# J3.1 LABORATORY ACCREDITATION

To undertake all analytical testing, El commissioned SGS as the primary laboratory and Envirolab as the secondary laboratory. SGS and Envirolab, both established analytical laboratories which operate in accordance with the guidelines set out in ISO/IEC Guide 25 "General requirements for the competence of calibration and testing laboratories", conducted all respective analyses using National Association Testing Authorities (NATA)-registered procedures.

In relation to contingencies, should the pre-determined DQOs not be achieved, in accordance with each laboratory's QC policy, respective tests are accordingly repeated. Should the results again fall outside the DQOs, then sample heterogeneity may be assumed and written comment will be provided to this effect on the final laboratory certificate.

# J3.2 SAMPLE HOLDING TIMES

All sample holding times were generally within standard environmental protocols as tabulated in **Appendix K**, **Tables QC1** and **QC2**.

# J3.3 TEST METHODS AND PRACTICAL QUANTITATION LIMITS (PQLs)

Practical Quantitation Limits for the tested parameters during the assessments are presented in **Appendix K**, **Tables QC3** and **QC4**.

#### J3.4 METHOD BLANKS

Concentrations of all parameters in method blanks during the assessment were below the laboratory PQLs and were therefore within the DAC.

# J3.5 LABORATORY DUPLICATE SAMPLES

The Laboratory Duplicate Samples for the analysis batches were within acceptable ranges and conformed to the DAC.

## J3.6 LABORATORY CONTROL SAMPLES

The Laboratory Control Samples for the analysis batches were within acceptable ranges and conformed to the DAC.

# J3.7 MATRIX SPIKES

The matrix spikes of the analysis batches were within acceptable ranges and conformed to the DAC.

Notes

RPD exceeds 30-50% range referenced from AS4482.1 (2005)

All soil results are reported in mg/kg.

F1 was obtained by subtracting the sum of BTEX concentrations from the C6-C10 fraction.

F2 was obtained by subtracting naphthalene from the > C10-C16 fraction.

Table J-3 Summary of QA/QC results for groundwater investigation

Indicates values where a single result is found to be less than detection, with the duplicate sample found to be over the detection limit.

RPD exceeds 30-50% range referenced from AS4482.1 (2005)

# Notes:

**52.17** 82.35 All water results are reported in µg/L.

F1 was obtained by subtracting the sum of BTEX concentrations from the C6-C10 fraction.

F2 was obtained by subtracting naphthalene from the > C10-C16 fraction.

COMMENTS

All the laboratory data for each environmental matrix was compared to SGS Environmental Services' stated Data Quality Objectives (DQO). Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the Chain of Custody document and was supplied by the Client. This QA/QC Statement must be read in conjunction with the referenced Analytical Report. The Statement and the Analytical Report must not be reproduced except in full.

All Data Quality Objectives were met (within the SGS Alexandria Environmental laboratory).

# **HOLDING TIME SUMMARY**

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampted, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

# **HOLDING TIME SUMMARY**

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule 8(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fall by default.

#### HOLDING TIME SUMMARY

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fall by default.

#### Trace Metals (Dissolved) in Water by ICPMS

#### Method: ME-(AU)-[ENV]AN318

Sample Name	Sample No.	QC Ref	Sampled	Received	Extraction Due	Extracted	Analysis Due	Analysed

SE147114 R0

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be hald before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

Volatile Petroleum Hydro	/olatile Petroleum Hydrocarbons in Water							
Sample Name	Sample No.	QC Ref	Sampled	Received	Extraction Due	Extracted	Analysis Due	Analysed
QR1	SE147114,014	LB091916	10 Dec 2015	11 Dec 2015	17 Dec 2015	16 Dec 2015	25 Jan 2016	17 Dec 2015

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Red with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

# **METHOD BLANKS**

Blank results are evaluated against the limit of reporting (LOR), for the chosen method and its associated instrumentation, typically 2.5 times the statistically determined method detection limit (MDL).

Result is shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria.

Dibromofluoromethane (Surrogate)

d4-1,2-dichloroethane (Surrogate)

d8-toluene (Surrogate)

Duplicates are calculated as Relative Percentage Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

# Trace Metals (Dissolved) in Water by ICPMS

Original Duplicate

Method: ME-(AU)-[ENV]AN318

Duplicates are calculated as Relative Percentage Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 It is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

# LABORATORY CONTROL SAMPLES

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA /QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria.

### **MATRIX SPIKES**

Matrix Spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

# MATRIX SPIKE DUPLICATES

Matrix spike duplicates are calculated as Relative Percent Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The original result is the analyte concentration of the matrix spike. The Duplicate result is the analyte concentration of the matrix spike duplicate.

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

No matrix spike duplicates were required for this job.

### **FOOTNOTES**

Samples analysed as received.

Solid samples expressed on a dry weight basis.

QC criteria are subject to internal review according to the SGS QA/QC plan and may be provided on request or alternatively can be found here: <a href="http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf">http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf</a>

- NATA accreditation does not cover the performance of this service.
- Sample not analysed for this analyte.
- IS Insufficient sample for analysis.
- LNR Sample listed, but not received.
- LOR Limit of reporting.
- QFH QC result is above the upper tolerance.
- QFL QC result is below the lower tolerance.
- ① At least 2 of 3 surrogates are within acceptance criteria.
- ② RPD failed acceptance criteria due to sample heterogeneity.
- ③ Results less than 5 times LOR preclude acceptance criteria for RPD.
- Recovery failed acceptance criteria due to matrix interference.
- S Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).
- O LOR was raised due to sample matrix interference.
- O LOR was raised due to dilution of significantly high concentration of analyte in sample.
- Reanalysis of sample in duplicate confirmed sample heterogeneity and inconsistency of results.
- Recovery failed acceptance criteria due to sample heterogeneity.
- LOR was raised due to high conductivity of the sample (required dilution).
- † Refer to Analytical Report comments for further information.

COMMENTS

All the laboratory data for each environmental matrix was compared to SGS Environmental Services' stated Data Quality Objectives (DQO). Comments ansing from the comparison were made and are reported below.

The data relating to sampling was taken from the Chain of Custody document and was supplied by the Client. This QA/QC Statement must be read in conjunction with the referenced Analytical Report. The Statement and the Analytical Report must not be reproduced except in full.

All Data Quality Objectives were met with the exception of the following:

Matrix Spike

Trace Metals (Dissolved) in Water by ICPMS

### HOLDING TIME SUMMARY

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled; although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Rod with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

### **SURROGATES**

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Red with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

### **DUPLICATES**

Duplicates are calculated as Relative Percentage Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

### LABORATORY CONTROL SAMPLES

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA /QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria.

### **MATRIX SPIKES**

Matrix Spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in Green when within suggested criteria or Red with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

# MATRIX SPIKE DUPLICATES

Matrix spike duplicates are calculated as Relative Percent Difference (RPD) using the formula: RPD = | OnginalResult - ReplicateResult | x 100 / Mean

The original result is the analyte concentration of the matrix spike. The Duplicate result is the analyte concentration of the matrix spike duplicate.

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

No matrix spike duplicates were required for this job.

### **FOOTNOTES**

Samples analysed as received.

Solid samples expressed on a dry weight basis.

QC criteria are subject to internal review according to the SGS QA/QC plan and may be provided on request or alternatively can be found here: <a href="http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf">http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf</a>

- NATA accreditation does not cover tthe performance of this service:
- Sample not analysed for this analyte.
- IS Insufficient sample for analysis.
- LNR Sample listed, but not received.
- LOR Limit of reporting.
- QFH QC result is above the upper tolerance.
- QFL QC result is below the lower tolerance.
- At least 2 of 3 surrogates are within acceptance criteria.
- ② RPD failed acceptance criteria due to sample heterogeneity.
- Results less than 5 times LOR preclude acceptance criteria for RPD.
- Recovery failed acceptance criteria due to matrix interference.
- Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).
- 6 LOR was raised due to sample matrix interference.
- O LOR was raised due to dilution of significantly high concentration of analyte in sample.
- ® Reanalysis of sample in duplicate confirmed sample heterogeneity and inconsistency of results.
- Recovery failed acceptance criteria due to sample heterogeneity.
- COR was raised due to high conductivity of the sample (required dilution).
- † Refer to Analytical Report comments for further information.
