Table of Contents

1 Introduction

ACOR Consultants (NNSW) were engaged by CSR Hebel to undertake a civil engineering design including site grading and stormwater management for a proposed additional facility located at 98 Wisemans Ferry Road, Somersby.

The objective of this report is to address the site grading and water cycle management for the site to meet the requirements of Gosford City Council's DCP Section 6.7 Water Cycle Management. The elements to be addressed include:

1. Site grading
2. Stormwater Conveyance;
3. Water Cycle Management including On Site Detention (OSD) and retention/reuse;
4. Stormwater Quality;
5. Erosion and Sediment Control.

2 Site

The site is located at Lot 22 D.P. 873845, 98 Wisemans Ferry Road, Somersby, New South Wales. CSR Hebel currently operate a facility on the neighbouring north property. The total usable site area of both the existing site and the new site is approximately 7.68 hectares. Figure 1 shows the location of the site.

The site generally drains to the south east to a tributary of Piles Creek.

Figure 2 shows a survey of the site in its existing condition.

The proposed expansion will consist of a factory building, hardstand area and a car park extension. The area of the proposed new development is approximately 3.24 ha. The new development will result in an increase to the impervious area of the site. The total impervious area of the site will be approximately 76%. Figure 3 shows the total site, including the proposed development.

3 Site Grading

The proposed development involves significant site grading to enable the levels of the new works to be a continuation of the existing site to the north. As the proposed development site falls to the south east, significant retaining is required to enable the continuation of the hardstand and circulation road from the existing northern site. By filling the site, general site grades will range between 3 and 5%.

Figure 4 shows the proposed grading of the new site. Figures 5 and 6 show the proposed levels and retaining at the southern extent of the site. Figures 7 to 12 show sections through the site. Figure 13 shows the cut and fill proposed for the site.

4 Stormwater Management

4.1 Stormwater Conveyance

Runoff from the new development will be directed to a stormwater reuse/detention tank to the east of the new development. Minor stormwater flows will be conveyed through a pit and pipe network to the

basin. Major flows will drain via an overland flow path to the basin. The existing stormwater drainage from the west of the site will be directed to the stormwater pipe system for the new development which will convey flows to the east to the proposed stormwater detention/reuse tank.

Figure 14 shows the proposed stormwater management plan for the site, including the new stormwater reuse/detention tank.

4.2 Water Cycle Management

The proposed water cycle management for the site, consists of water quantity (detention and retention) as well as water quality which will consist of a tank for both detention as well as reuse in the manufacturing processes on the site. Figure 14 shows the stormwater management plan for the proposed development.

4.3 STORMWATER RETENTION

4.3.1 Stormwater Retention

In accordance with section 6.7.7.2.4 Deemed to Comply of Gosford Council's DCP, the total volume of retention required is calculated using the following formula:

$V = 0.01A\ (0.02F)^2$

Where V =stormwater retention volume (m^3), A = Total site area (m^2) and F = fraction impervious (%).

The area of the new development site is 37,290 m^2(including the south western environmentally protected area). The fraction impervious of the site is approximately 73%. From the above information, a stormwater retention volume of 795 m^3 is required for the development. A volume of 800 m^3 has been adopted for retention for the site.

4.3.2 Stormwater Reuse

The stormwater retention will be utilised for reuse in the new factory in the manufacturing process in the ball mill and/or the slurry wash. It is estimated that 75 kL of water per day will be reused in the manufacturing process. This volume has been adopted for the modelling. When the required volume is not available in the tank, mains water will be used in the ball mill and slurry wash.

A water balance was undertaken using the MUSIC (Model of Urban Stormwater Improvement Conceptualisation) Model adopting the retention volume for the site of 800 m^3. Runoff from the new development as well as the existing development will be directed to the storage tank.

Modelling of the reuse with 800 m^3 of storage indicates that, on average, the reuse demand of 75 kL/day for the ball mill and/or slurry wash will be met 71% of the time throughout the year. This equates to an average annual reduction in potable water usage of 19.0 ML. Details of the MUSIC model including the water balance can be found in Appendix A.

4.4 On-Site Detention

4.4.1 General

Detention is required to limit the developed peak flows from the site to the predeveloped peak flows. To size the detention requirements, a hydrologic/hydraulic model was developed using the DRAINS program to determine the volume of detention required for the site.

4.4.2 Drains Modelling

DRAINS modelling was undertaken to determine the predeveloped and developed peak flows for a range of ARI's from 1 to 100 years, for storm durations ranging from 5 minutes to 4.5 hours. The predeveloped vs development peak flows for the total site with no detention are shown in Table 1. Predeveloped flows assume the southern site is in an undeveloped state, while the existing northern site is in its current developed state. Details of the DRAINS modelling are shown in Appendix B.

Table 1: Predeveloped vs Developed (no detention) Total Peak Flows from the Total Site

ARI (Years)	Pre-Developed Peak Flow (m^3/s)	Developed Peak Flow (no detention) (m^3/s)	Increase (%)
1	1.11	1.56	41
2	1.66	2.09	26
5	2.29	2.72	19
10	2.69	3.08	14
20	3.17	3.56	12
50	3.38	3.76	11
100	3.77	4.17	11

From Table 1 it can be seen that the proposed development increases the peak flows from the total site when compared to the existing peak flows. To mitigate the peak flows from the site and restrict them to the predeveloped peak flows, detention is required.

A detention tank configuration consisting of a volume of 1100 m^3 (peak detention volume), a low-level outlet of 4 x 525 mm diameter pipes and a 6 m wide weir was modelled in DRAINS. The detention volume is required above the reuse volume (total tank volume 1900 m^3). Table 2 shows the predeveloped peak flows vs the developed peak flows with the above detention configuration for the total site. Figure 15 shows the reuse/detention tank details. DRAINS inputs and results for the detention modelling can be found in Appendix B.

Table 2: Predeveloped vs Developed (with detention) Total Peak Flows from the Site

ARI (Years)	Pre-Developed Peak Flow (m^3/s)	Developed Peak Flow (with detention) (m^3/s)	Reduction (%)
1	1.11	1.13	2
2	1.66	1.49	-10
5	2.29	1.87	-18
10	2.69	2.07	-23
20	3.17	2.62	-17
50	3.38	3.03	-10
100	3.77	3.30	-12

As can be seen from Table 2, the detention configuration modelled reduces the peak flows from the total site for all ARIs to equal to or below the predeveloped peak flows except for the 1 year ARI storm event. To simulate the worst case scenario, the model was run assuming the reuse volume of the tank was full. It is expected that some additional volume from the reuse portion of the tank would be available in most storm events which would reduce the developed peak flows to below those in the Table 2.

4.5 WATER QUALITY

4.5.1 General

The water quality treatment for the site will be by reuse in the manufacturing process and a gross pollutant trap (Ecosol GPT or equivalent) to reduce the volume of pollution entering the retention/detention tank. As discussed in section 4.3, a reuse volume of 800 m^3 is proposed for the facility. Water use for the new facility has been estimated at 75 kL per day.

4.5.2 Objectives

Section 6.7.7.3.2 of Gosford Council's DCP states the water quality objectives for the site is:

- Total Suspended Solids: 80%
- Total Phosphorus: 45%
- Total Nitrogen: 45%

4.5.3 Water Quality Modelling

4.5.3.1 General

Water quality modelling was undertaken in the MUSIC (Version 6.1.0) program. The inputs for the model are described below. The catchment entering the tank includes the existing hardstand area and the existing factory roof area.

4.5.3.2 Rainfall and Evapotranspiration

The rainfall and evapotranspiration data was adopted for the Sydney Observatory Hill Rainfall Station with a 6-minute time step.

4.5.3.3 Rainfall/Runoff Catchment Parameters

The rainfall and runoff catchment parameters were adopted from the default values from the NSW MUSIC Modelling Guidelines. Details of the MUSIC modelling inputs are shown in Appendix A.

The water quality parameters adopted for the site were for general urban.

4.5.3.4 Stormwater Treatment Measures

The main treatment measure for the site will be reuse via retention/detention tank. The volume of the tank for retention/reuse is 800 m^3. An Ecosol GPT (or equivalent) will be constructed upstream of the reuse tank to reduce the volume of pollutants entering the tank.

The Ecosol GPT unit is an inline system, that removes 99% of pollutants larger than 2 mm as well as 80% of TSS and 45% of the nutrients TP and TN from the incoming stormwater flows.

4.5.4 Results

The pollutant reductions from the water quality infrastructure for the total site from the MUSIC modelling are shown in Table 3.

Table 3: Total Site Pollutant Reduction

Pollutant	MUSIC Model Reduction	GCC Water Quality Reduction Objectives
TSS	81%	80%
TP	62%	45%
TN	49%	45%

As can be seen from Table 3, the pollutant reductions from the total site including the existing development exceed the GCC requirements for TSS, TP and TN.

4.6 Erosion and Sediment Control

During construction of the development, erosion and sediment control will be required to limit the pollutant runoff from the site into the existing downstream stormwater drainage system. Erosion and sediment controls such as sediment fencing, pit inlet filters and stabilized site access will be adopted to control the sediment runoff from the site until the development is sufficiently stabilized, and the new stormwater management and drainage system is constructed.

The water reuse tank will be able to be used as a sediment basin during the construction process, prior to the site being sealed.

The erosion and sediment controls will be in accordance with Landcom's Managing Urban Stormwater: Soils and Construction, Volume 1, 4th Edition, March 2004 (The Blue Book) and the requirements of Gosford City Council.

Figure 16 shows a concept erosion and sediment control plan for the development.

5 Conclusion

This civil engineering and stormwater management plan was undertaken for the proposed CSR Hebel Line 2 development located at 98 Wisemans Ferry Road, Somersby.

Significant site grading is required for the development including large retaining structures around the site boundary as well as between the existing factory and the proposed factory. General grading of the hardstand areas will be in the range of 3 to 5%.

Stormwater runoff from the site will be conveyed via a pit and pipe system to the detention/reuse tank.

Stormwater quantity for the site will be addressed by a tank that will act as both a detention and a reuse tank. Overflows from the tank will be directed to the existing site stormwater outlet to the creek tributary. The peak flows from the site have been reduced to below the current peak flows leaving the site.

Water quality for the site will be treated by the reuse tank as well as an Ecosol GPT (or equivalent) upstream of the tank to reduce the volume of pollutants entering the tank. The combination of the reuse tank and GPT reduce the pollutants in the runoff to the requirement of Gosford City Council.

Erosion and sediment controls will be implemented during the construction process to the requirements of Gosford City Council.
