**RE: Proposed school, Seventeenth Avenue, Austral-Council concerns**

ETS has reviewed the recent comments and the concerns raised by Council officers in regards to the proposed school development. The following are the responses against each of the traffic management concerns raised:

1. **Council concern:** The proposed combined driveway off the north-south road is too close to the intersection.

**Response:**

During a consultation meeting with Council's traffic engineers it was agreed by both parties that this access will be deleted. The parking lot next to it will be designated for staffs and accessed via the proposed driveway off Seventeenth Avenue. A revised plan will reflect this.

2. **Council concern:** The applicant is to address the pavement width and conditions of Seventeenth Avenue and its suitability to be utilised as a bus route. All bus bays should be located in the proposed roads and not in Seventeenth Avenue. Seventeenth Avenue is to be widened along the frontage of the property prior to enrolment of the 150<sup>th</sup> student.

**Response:**

As per Austral and Leppington North (ALN) precincts Indicative Layout Plan, Seventeenth Avenue is on a more direct route in the area wide street network, compared to the proposed north-south road and more suitable for a bus route.

During the consultation meeting with Council's traffic engineers it was agreed by both parties that the proposed bus bays both in Seventeenth Avenue and the proposed north-south ILP road will be retained. However, both of the bus bays will be designated as on-street public bus zone.

Indented bus bays have been proposed on both Seventeenth Avenue and the north-south road which is in excess of the ILP road width. The bus bays are separated from trafficable lanes. Therefore no potential conflicts between a stopped bus and traffic within traffic lane.

3. **Council concern:** Seventeenth Avenue and all new roads are to be in accordance with the DCP Indicative Layout Plan.

**Response:**

The existing Craik Avenue, Seventeenth Avenue and the proposed north-south and east-west roads are in accordance with the Indicative Layout Plan (ILP). The width proposed for the north-south and east-west road exceeds the ILP requirement.

4. **Council concern:** There is no information on ‘school zones’ and external pedestrian crossing facilities.

**Response:**

The location of a proposed pedestrian crossing in Seventeenth Avenue has been identified in the revised plan. The proposed driveway is approximately 20m to the west of the proposed access off Seventeenth Avenue and approximately 40m to the east of Craik Avenue intersection. The 40m length between Craik Avenue and the proposed pedestrian crossing is likely to be sufficient to contain any queue of vehicle giving way to pedestrians crossing Seventeenth Avenue.

5. **Council concern:** The assumption that about 60% of students will use bus services and 40% of students will be driven to and from school (with a vehicle occupancy rate of 2 per vehicle) is very high and needs to be verified.

**Response:**

A further assessment has been undertaken with a revised modal split, vehicle occupancy rate and development traffic distribution pattern. In the revised assessment it is assumed that 20% of students will use bus services and 80% of students will be driven to and from school. A vehicle occupancy rate of 1.2 has been used. As part of the assessment, the impact of the development traffic at the intersection of Craik Avenue and Seventeenth Avenue has been assessed by way of intersection modeling using SIDRA. All the related background information has been reproduced below along with the revised assumptions and analysis.

The proposed development site is subject to rezoning under Austral and Leppington North (ALN) precincts. In the Indicative Layout Plan for the precinct Craik Avenue is classified as Collector Road and Seventeenth Avenue is classified as local road. The following Table-1 has been extracted from Austral and Leppington North (ALN) Precincts Transport Assessment Post-Exhibition Traffic Report (Addendum) prepared by AECOM. Table-1 shows the predicted **year 2036** mid-block traffic volume and the classification of the roads within the precinct.

P:\60159585\_ALN\_Tpt6. Draft docs\6.1. Reports\Post exhibition addendum traffic report\_120704.docx  
Revision D - 04 July 2012

The predicted year 2036 traffic volumes in Table-1 above is considered the future background traffic for the purpose of this study and has been used to predict the traffic volume on Craik Avenue.

Seventeenth Avenue is classified as local road and estimated to have low traffic volumes and generally have volumes less than 1500 to 2000 vehicles per day and 200 vehicles in the peak hour. A fourth leg has been proposed at this intersection as part of the precinct plan street network.

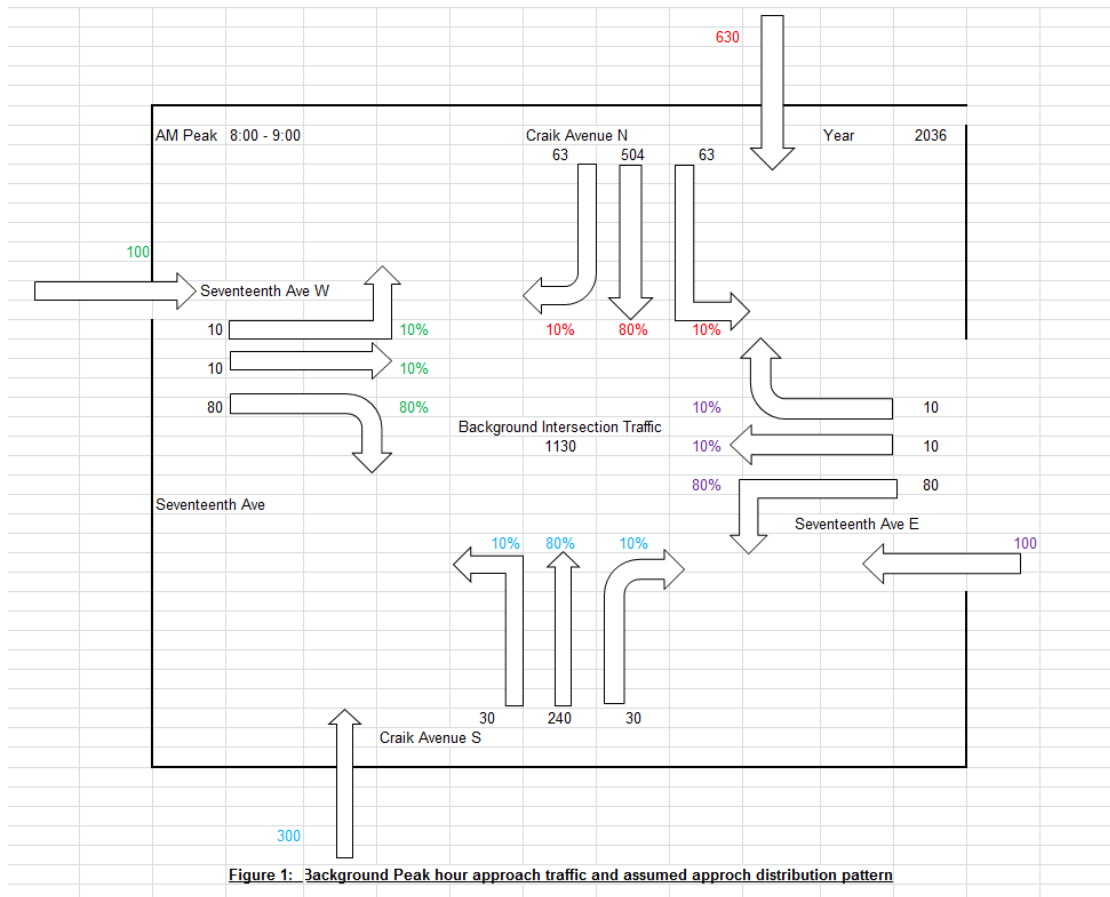

## **E x p r e s s   T r a f f i c E n g i n e e r i n g   S o l u t i o n s**

As no turning volumes at the intersections have been shown in the traffic and transport study for Austral and Leppington North Precinct prepared by AECOM, the following assumptions have been made in order to estimate the traffic distribution at the intersection of Craik Avenue and Seventeenth Avenue for the purpose of this study:

1. The highest predicted mid-block volumes for a collector road as stipulated in Table-1 have been assumed to be the mid-block volumes for Craik Avenue in the year 2036.
2. The mid-block peak hour volume for Seventeenth Avenue assumed to be 200 vehicles in the peak hour given that it is classified as a local road. This equates to 2000 vehicles daily.
3. The morning peak has been considered to be most critical compared to evening peak, as the commuter peak (4pm-6pm) do not coincide with school afternoon peak (2:30pm-4pm).
4. It is reasonable to assume that majority of the precinct traffic (80%) will be leaving the precinct via collector roads and 20% of the trips will be within the precinct.
5. In order to test the worst-case-scenario it is also assumed that 85% of the proposed school traffic will arrive and depart via the intersection of Craik Avenue and Seventeenth Avenue and the remaining 15% will be via Seventeenth Avenue East.

The following Figure-1 shows the individual approach distribution of future background traffic at the intersection of Craik Avenue and Seventeenth Avenue in year 2036 that has been estimated considering the above assumptions.

# Express Traffic Engineering Solutions

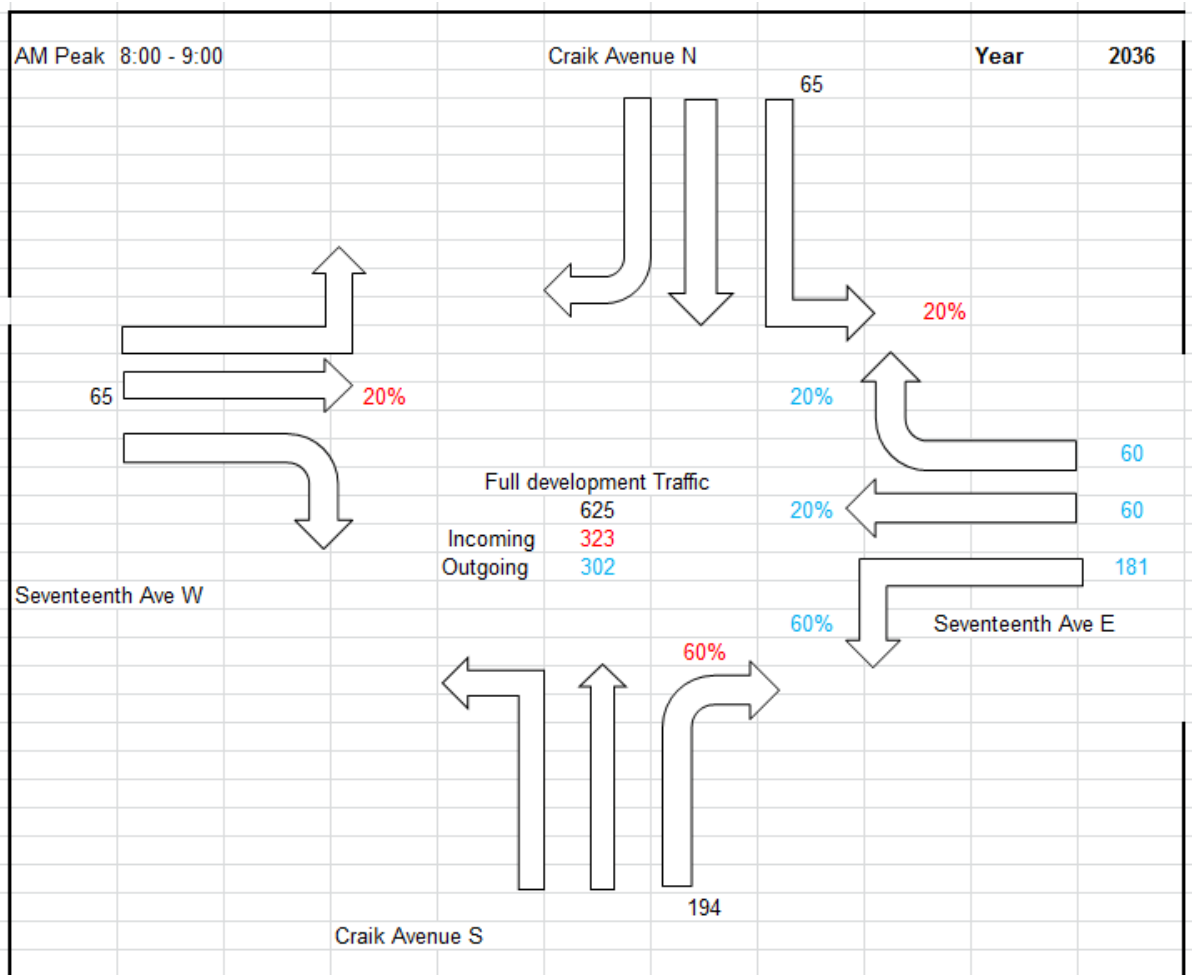

The development trips have been calculated in the following table applying first hand principle:

Table 2: Development Traffic

| Development Trip Generation                       |     |          |          |
|---|-----|----------|----------|
| Total Students                                    |     | 800      |          |
| Staff   |     | 36       |          |
| Students bus transport @                          | 20% | 160      |          |
| Students car transport @                          | 80% | 640      |          |
| Student car occupancy @                           | 1.2 |          |          |
| Number of vehicles transporting student           |     | 533      |          |
| Morning Peak Period 8:00am-9:30am                 |     |          |          |
|   |     | Incoming | Outgoing |
| Staff   |     | 36       | 0        |
| Students  |     | 533      | 533      |
| Total Morning Peak Period Trips                   |     | 569      | 533      |
| Total Morning Peak Hour Trips (60 mins)           |     | 380      | 356      |
| Total combined trips in the peak hour             |     |          | 735      |
| Through intersection of Craik and Seventeenth Ave | 85% | 323      | 302      |
| Total development Traffic                         |     |          | 625      |

# E x p r e s s   T r a f f i c E n g i n e e r i n g   S o l u t i o n s

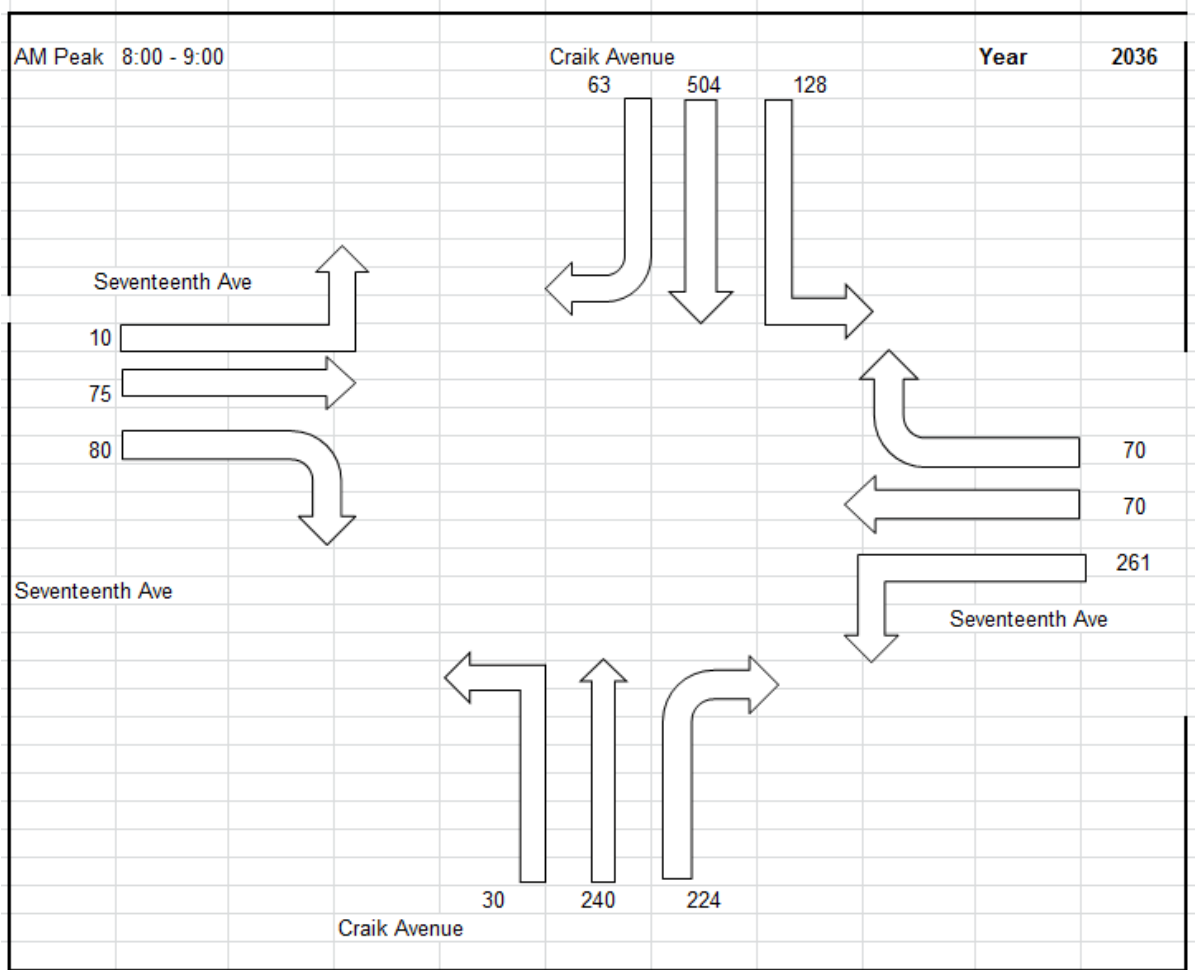

85% of the total school trips from Table- 2 have been distributed at the intersection of Craik Avenue and Seventeenth Avenue applying the distribution pattern shown in Figure-2.

**Figure 2: Peak period development traffic distribution**

Figure-3 below is showing the background plus the development traffic distribution at the intersection of Craik Avenue and Seventeenth Avenue in **year 2036**.

# Express Traffic Engineering Solutions

**Figure 3 : Background + development Peak hour traffic distribution**

An intersection count has been undertaken at the intersection of Craik Avenue and Seventeenth Avenue which is currently a T-intersection in order to capture the traffic generated from the existing school at 88 Gurner Avenue that have been using this intersection. The summary of the survey results have been shown in Figure -4.

Currently there are approximately 188 students enrolled in the existing school in Gurner Avenue. The current approval is for 350 students. The surveyed traffic volume in Figure-4 with respect to 188 students have been extrapolated for the current approval of 350 students and shown in Figure-5.

# Express Traffic Engineering Solutions

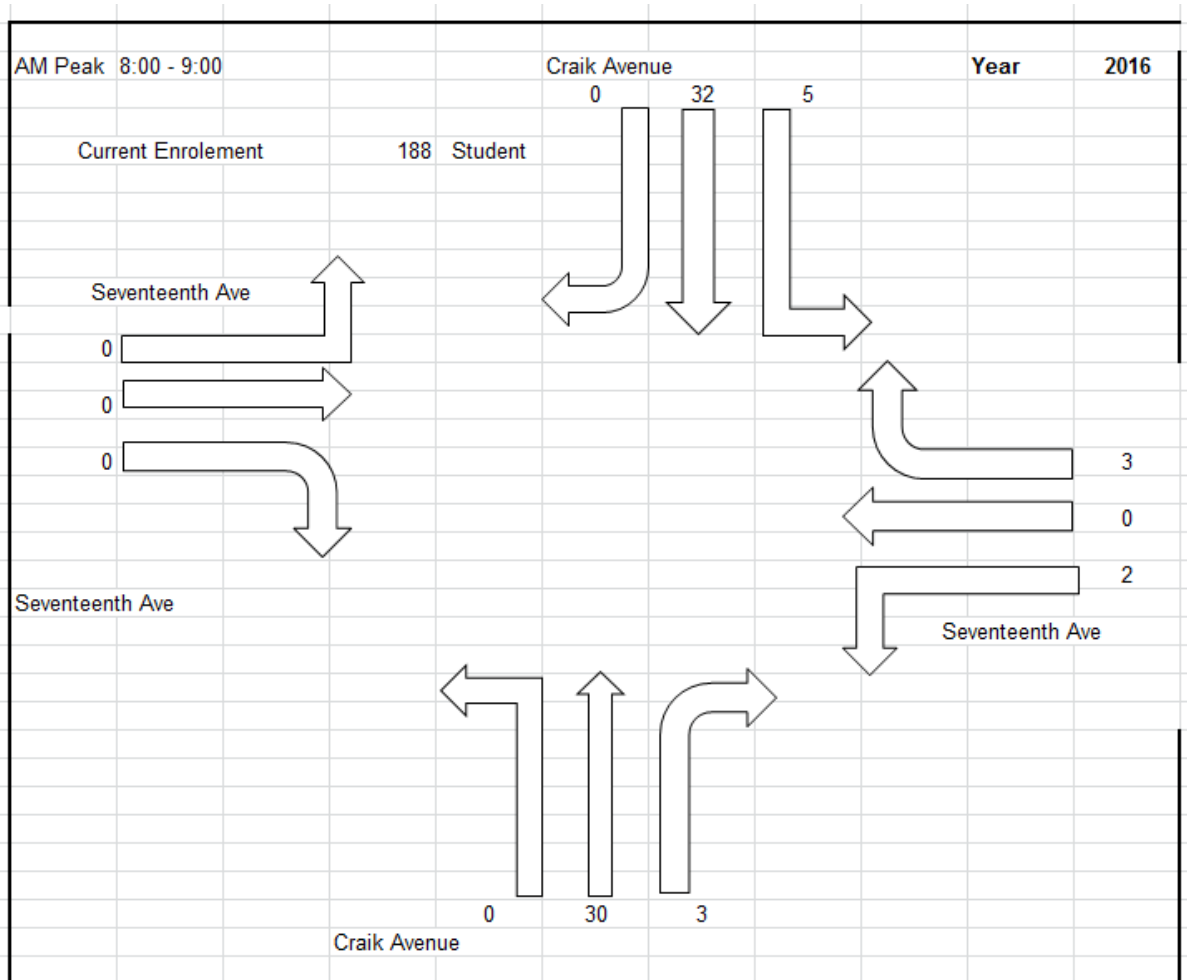

Figure 4 : Surveyed existing school peak hour traffic

**E x p r e s s   T r a f f i c  
E n g i n e e r i n g   S o l u t i o n s**

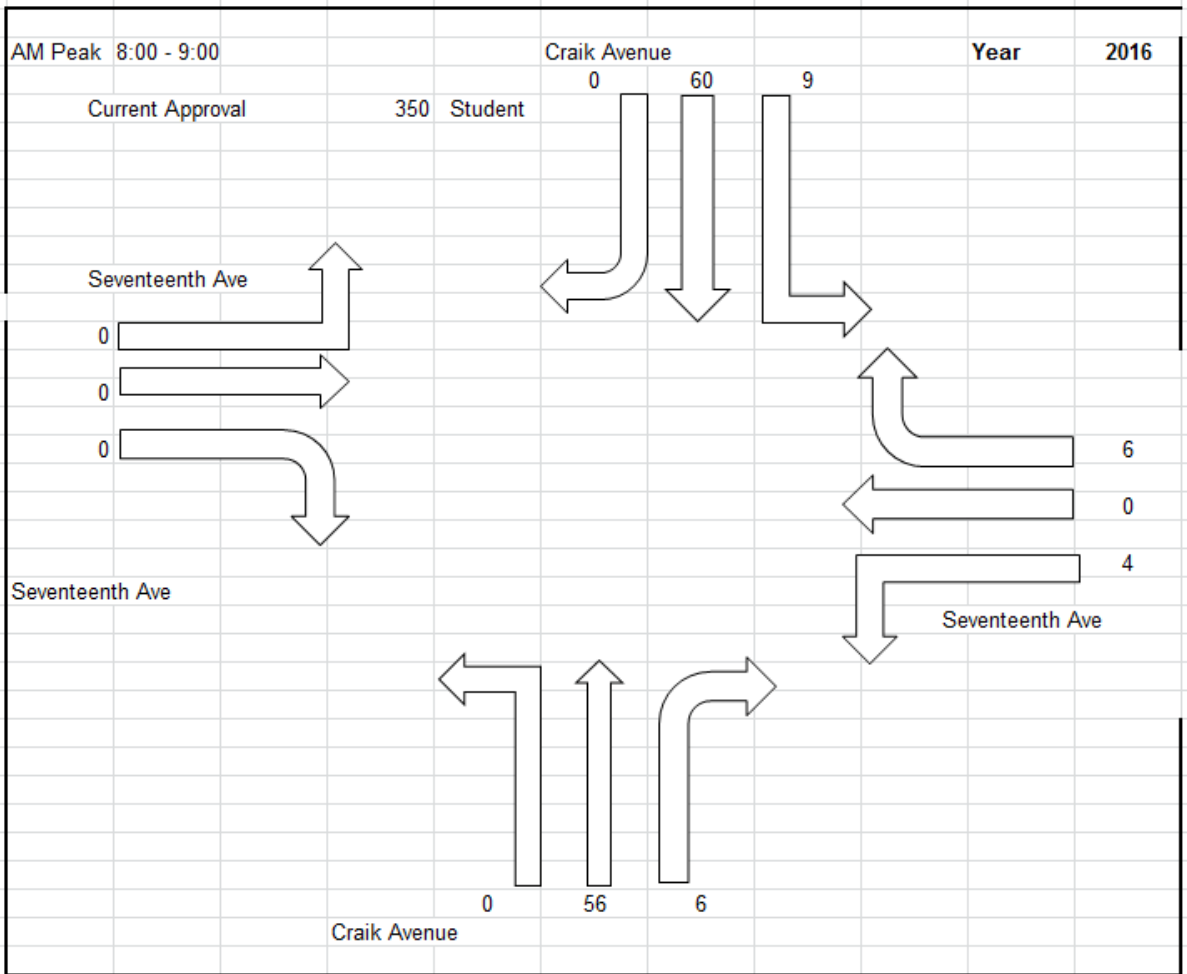

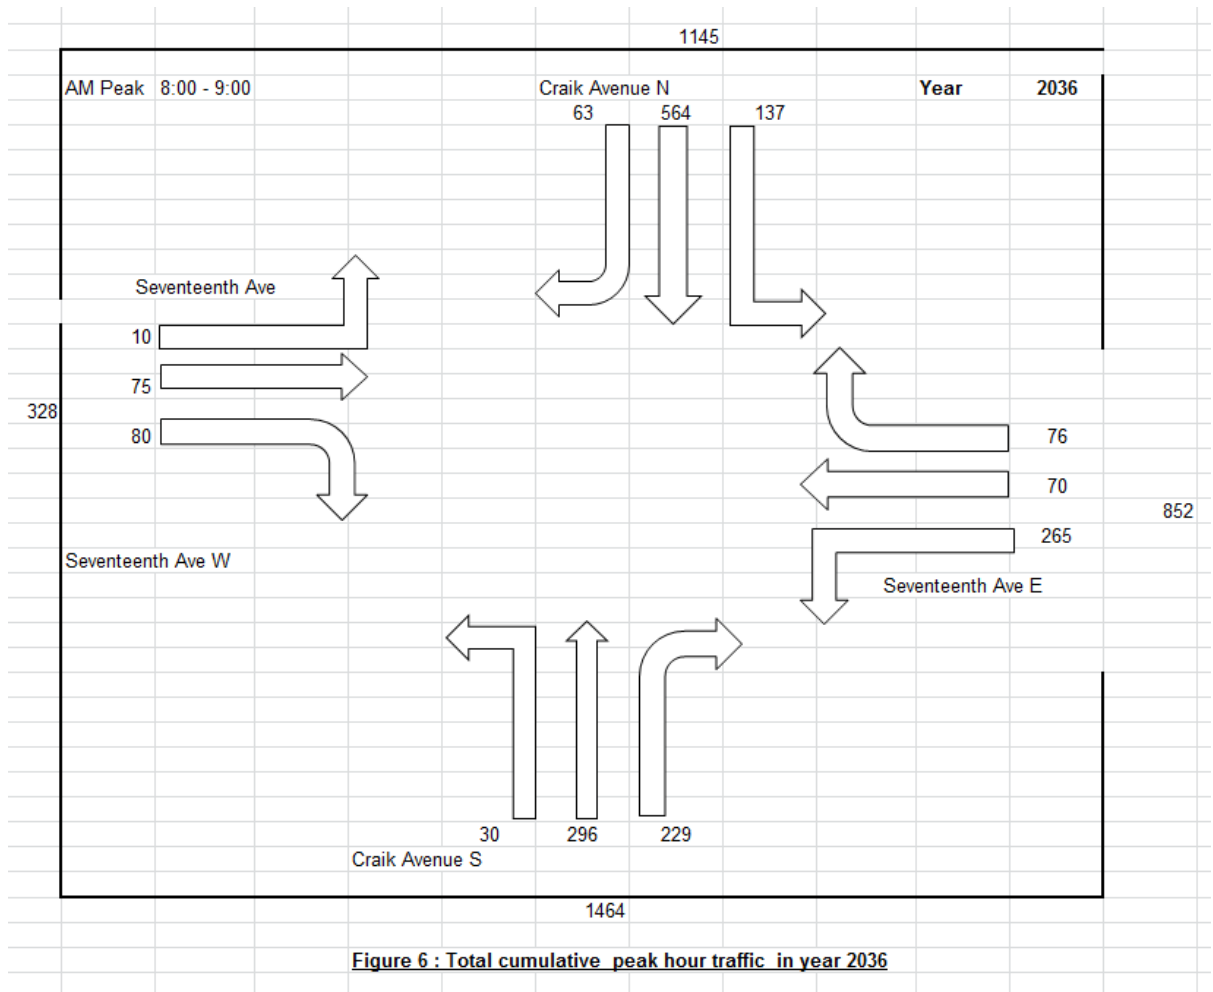

Figure 5 : existing school peak hour traffic extrapolated for 350 students

In order to identify the cumulative impact of the proposed development in year 2036, the existing school traffic that have been utilising the intersection of Craik Avenue and Seventeenth Avenue forecasted for current approval of 350 students has been added to the future background precinct traffic and the proposed school development traffic and shown in Figure-6.

# Express Traffic Engineering Solutions

The intersection of Craik Avenue and Seventeenth Avenue, Austral has been modelled using computer based micro-simulation software 'SIDRA Intersection' to analyse various traffic parameters of the intersection for the future scenario.

SIDRA Intersection calculates the amount of delay experienced by vehicles using an intersection, and gives a Level of Service rating which indicates the relative performance of that intersection with regard to the average delay (seconds per vehicle) experienced by vehicles at the intersection. The average delay reported for signalised intersections is taken over all movements, while for unsignalised intersections the average delay is reported for the worst movement only.

# E x p r e s s   T r a f f i c E n g i n e e r i n g   S o l u t i o n s

The Level of Service criteria set by the RTA is outlined in **Table-3**

**Table- 3: Level of Service Criteria (LoS)**

| Level of Service | Average Delay (seconds/vehicle ) | Traffic Signals, Roundabout                                   | Give Way and Stop Signs                   |
|------------------|----------------------------------|---|---|
| A                | Less than 14                     | Good operation  | Good operation                            |
| B                | 15 to 28                         | Good with acceptable delays and spare capacity                | Acceptable delays and spare capacity      |
| C                | 29 to 42                         | Satisfactory  | Satisfactory, but accident study required |
| D                | 43 to 56                         | Operating near capacity                                       | Near capacity and accident study required |
| E                | 57 to 70                         | At capacity; at signals incidents will cause excessive delays | At capacity, requires other control mode  |
| F                | More than 70                     | Roundabouts require other control mode                        |   |

Source: Guide to Traffic Generating Developments, RTA 2002.

The traffic volumes in Figure-6 have been used as input volumes in the micro-simulation software ‘SIDRA Intersection’ in order to test the cumulative impact of the proposed school development. The intersection has been modelled as a ‘Give Way’ sign controlled intersection.

The results of the SIDRA analysis of the intersection of Craik Avenue and Seventeenth Avenue under the estimated traffic volume in the year 2036 are shown in **Table-4** below.

**Table-4: Intersection operation Craik Avenue/Seventeenth Avenue Austral (Morning peak)**

| Intersection                  | Scenario          | Year | Worst Approach AM Peak |                         | Intersection |                         |
|-------------------------------|-------------------|------|------------------------|-------------------------|--------------|-------------------------|
|                               |                   |      | LoS                    | Average Delay (Seconds) | DoS          | Average Delay (Seconds) |
| Craik Ave/<br>Seventeenth Ave | Future Cumulative | 2036 | D                      | 45.6                    | 0.9          | 14.5                    |

The results of the analysis show that the worst approach of the intersection is operating at a Level of Service (LoS) of ‘D’ in the morning peak hour under the estimated traffic volumes in the year 2036. This includes the cumulative traffic of the proposed school development, existing school in Gurner Avenue and the Austral Precinct traffic in the year 2036. Therefore modelling results of the intersection

**E x p r e s s   T r a f f i c  
E n g i n e e r i n g   S o l u t i o n s**

indicated that the intersection will be operating at an acceptable level as a sign controlled intersection. Detailed SIDRA outputs of the model have been attached.

6. **Council concern:** The applicant is to address the provision of a roundabout at the intersection of Seventeenth Avenue and Craik Avenue.

**Response:**

Based on the analysis above the proposed school development will have minimal impact on the operation of the intersection of Craik Avenue and Seventeenth Avenue. The intersection can operate as a sign controlled intersection under the future traffic load in the area which includes the proposed school development at its full capacity in year 2036. Therefore the control of the intersection of Craik Avenue and Seventeenth Avenue is not essential to be altered to a roundabout due to the proposed school development in Seventeenth Avenue.

If you need any further information or clarification please give me a call on 0425819206

Yours Sincerely

.....  .....

Level of Service (LOS) Method: Delay (RTA NSW).

Vehicle movement LOS values are based on average delay per movement

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

|-----|-------|------|-------|------|--------------|
| LOS | NA    | C    | NA    | D    | NA           |

Level of Service (LOS) Method: Delay (RTA NSW).

Lane LOS values are based on average delay per lane.

Minor Road Approach LOS values are based on average delay for all lanes.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road lanes.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

# Express Traffic Engineering Solutions

## DELAY (CONTROL)

Average control delay per vehicle, or average pedestrian delay (seconds)
