MAINTENANCE PROGRAM

The typical range of maintenance tasks required over a 12 month period is summarised in the table. Any information provided in the table must be assessed in the light of the weather and general site conditions. For example, watering frequency depends on the soil drainage and rainfall; fertiliser type and frequency needs to be adjusted to suit the plant requirements and the soil fertility and pH.

MULCH
Mulch will need to be topped up periodically to maintain a min. depth of 75mm. Mulch should be kept at least 50mm away from plant stems to reduce the risk of collar rot.

WEEDS
Weeds in mulched beds will need to be controlled by hand pulling or by the use of non residual herbicides. When using herbicides be very careful to avoid spray drifting onto valuable plants. The smallest contact with the chemicals can cause damage.

PLANT MAINTENANCE
Deep watering once or twice a week is more beneficial to plants than frequent light watering. Frequent watering will produce shallow roots and make the plant less stable and susceptible to drought. Maintain moisture to the bottom of the rootball for the first 3 months. To help safeguard plants remove labels immediately after planting. Where plants are susceptible to damage by vehicles to pedestrians, maintain protective fences until plants are well established. Replace dead plants fortnightly until such time as alternative maintenance procedures are in place.

LAWN MAINTENANCE
Once lawn has been established, carry out watering and fertilising as suggested in the typical maintenance program. In summer, through watering, two or three times each week will encourage roots to go deeper in search of water. Mow grass as required to maintain an even tidy appearance.
