Report on Preliminary Site Investigation (PSI) for Contamination
Proposed Harrington Waters Lifestyle Village
26, 48 and 56 Manor Road, Harrington

1. Introduction

This report presents the results of a preliminary site investigation (PSI) for contamination undertaken for the proposed Harrington Waters Lifestyle Village at 26, 48 and 56 Manor Road, Harrington. The investigation was commissioned in an email dated 3 June 2019 by Danny Bayly of Bayline Homes and Developments and was undertaken with reference to Douglas Partners Pty Ltd (DP) proposal PMQ190028 dated 31 May 2019.

It is understood that an eleven (11) stage subdivision is proposed for the site which covers an area of approximately 23 hectares and will include the following:

- 292 residential allotments;
- Upgrade of Manor Road to include kerb and guttering, approximately 380 m in length;
- Approximately 4 km of internal roadways;
- Car parking and caravan storage;
- Wetland areas adjacent to Manor Road;
- Proposed detention basins;
- Sewer pump station;
- Village green including retail shops, short term accommodation and rec centre; and
- Tennis courts, club house, gym, bowling green and a Mens shed.

The aim of the PSI was to undertake and provide comment on the following:

- Desktop review including review of geological, topographic and acid sulfate soil risk maps;
- Brief site history review to assess the potential for contamination at the site;
- Site inspection by a geo-environmental engineer to identify areas of potential contamination and assess current site conditions;
- Collection of near surface soil samples;
- Laboratory testing of selected soil samples for a range of potential organic and inorganic contaminants and for assessment of acid sulfate soil (ASS) conditions;
- Preparation of this report presenting the results of the assessment.

The PSI was undertaken with reference to NSW EPA 'Guidelines for Consultants Reporting on Contaminated Sites' (EPA, 2011) and NEPC (2013). The acid sulfate soil investigation was undertaken with reference to ASSMAC (1998) and QASSIT (2014).

2. Site Description

The site extends across three lots being Lot 2 DP1219123 (26 Manor Road), Lot 4 DP1219124 (48 Manor Road) and Lot 6 DP1217806 (56 Manor Road), Harrington, NSW, as shown on Drawing 1 in Appendix E. The site covers an area of approximately 23 hectares and has a northern frontage of 520 m to Manor Road and Harrington Road.

The site is bounded to the north by Manor Road and Harrington Road, to the east by existing residential development, to the south and west by rural residential properties and the Manning River beyond to the south.

The site is currently zoned R5 'Large Lot Residential' and E2 'Environmental Conservation' under the current Mid-Coast LEP 2010

At the time of the inspection the site comprised a grassed covered area with a number of mature to semi mature trees along the northern frontage and sporadically across the site but mainly constrained to the northern parts of the site. An existing weatherboard house was present in the north western portion of the site which included numerous stockpiles of demolition waste (including metal sheeting, concrete, bricks, metal scaffolding, timber, concrete and tiles). Near to the house was an above ground metal fuel storage tank on a metal stand. A large stockpile of soil with a smaller stockpile of soil, bricks and concrete was also located within the north western portion of the site.

3. Regional Geology, Soil Landscape and Acid Sulfate Soil Mapping

3.1 Geology

Reference to the 1:25,000 scale NSW NCCA Quaternary Geology data set (Figure 1) indicates the site is underlain by Pleistocene aged coastal barrier (yellow shading), which typically comprises marine sand, indurated sand, silt, clay, gravel, organic mud and peat. The coastal barrier materials are generally characterised as low pyrite, low carbonate and low organic content soils. The southern tip of the site is mapped as comprising Holocene aged estuarine plain (green shading), which typically comprises marine sand, silt, clay, shell and gravel. The estuarine plain materials are generally characterised as moderate pyrite, high carbonate and low organic content.

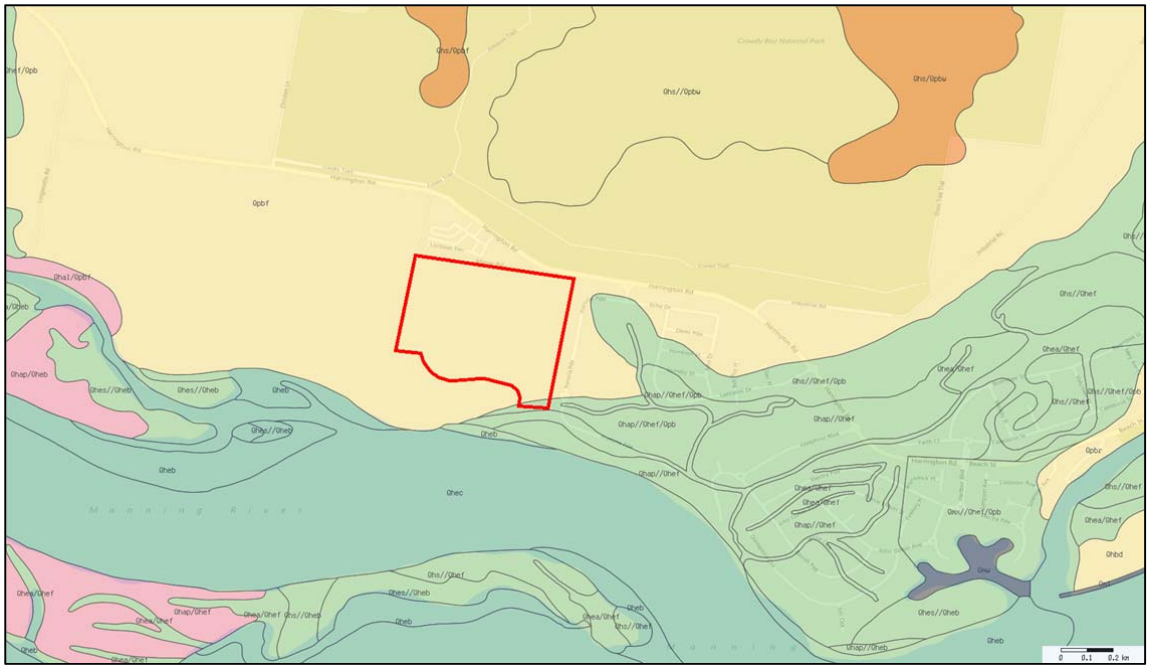

Figure 1: NCCA Quaternary and bedrock geology map with approximate site location (red square)

3.2 Soil Landscape

Reference to the Soil and Land Resources of the Hunter Region (Figure 2) indicates the site is mapped as comprising aeolian soils of the Harrington landscape (green shading). Also within close proximity to the east is mapped as comprising disturbed terrain (purple shading) associated with the previous residential development.

The Harrington landscape is characterised by “level plain to gently undulating plain on Pleistocene backbarrier quartz sands”. The soils within this landscape are characterised as “non-cohesive, wind erosion hazard, poor drainage, seasonal waterlogging”.

Figure 2: Soil landscape map with approximate site location (red square)

3.3 Acid Sulfate Soils

Reference to the Cundletown 1:25,000 Acid Sulfate Soil Risk Map (Figure 3) indicates the majority of the site is located within an area of "*low probability of occurrence at depths between 1 m and 3 m below the ground surface*" (yellow shading). The south eastern corner of the site is located within an area of "*high probability of occurrence between 1 m and 3 m below the ground surface*" (red shading).

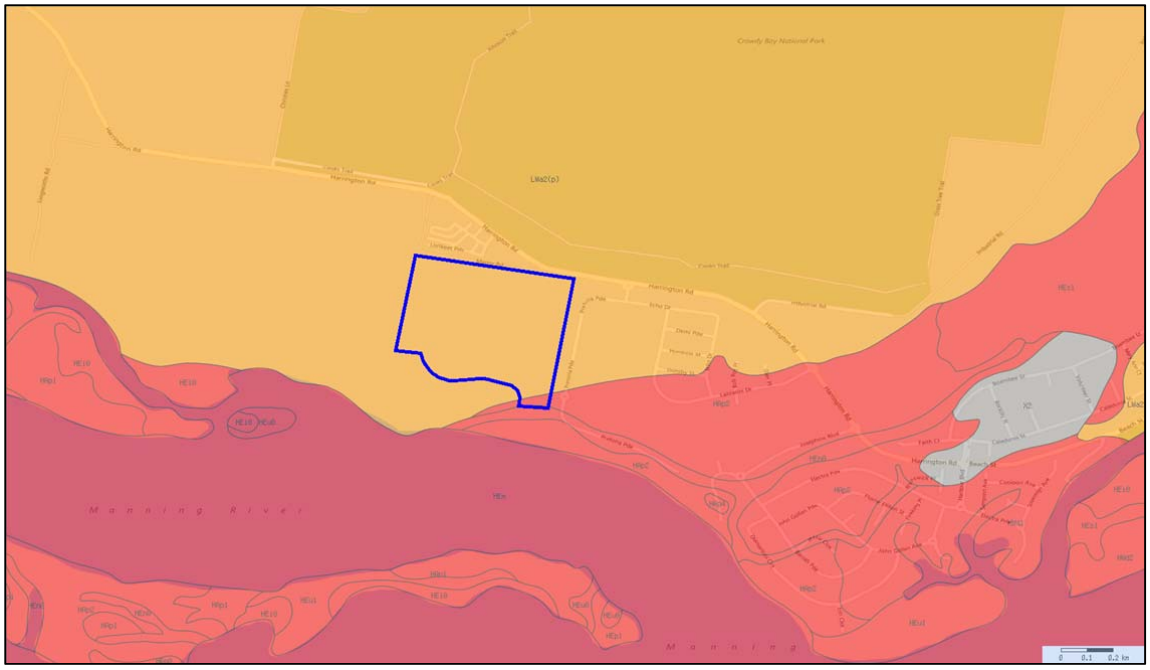

Figure 3: Acid Sulfate Soils Map with approximate site location (red square)

4. Hydrogeology

An online groundwater bore search undertaken with Water NSW indicated that one registered groundwater well is located within 500 m of the site. The nearest registered groundwater well (GW033008.1.1) is located approximately 400 m to the east of the site. The well was drilled to a depth of 3.7 m in 1971, with no further details available. The quality of groundwater in the area is unknown.

Groundwater at the site is expected to flow in a southerly direction towards the Manning River which is located approximately100 m to 250 m to the south of the site. This water body is considered to be the nearest environmentally sensitive receptor.

5. Site History

5.1 Extent of Site History Review

The brief review of site history comprised the following:

- Review of previous DP geotechnical and environmental assessments within the nearby area;
- Historical title deed search;
- Review of historical aerial photos;
- Searches with NSW EPA; and
- Searches of available Council and Government records.

Details are presented in the following sections.

5.2 Previous Douglas Partners Reports

DP has undertaken two previous geotechnical investigations at the site and a number of investigations in the nearby area particularly with the adjacent Harrington Waters development to the east.

The previous investigations undertaken on the site included excavation of 20 test pits, drilling of seven (7) test bores, installation of groundwater monitoring wells at each test bore location to assess water level, assessment of acid sulfate soil conditions, infiltration testing at ten (10) locations, in-situ permeability testing, geotechnical laboratory testing and engineering analysis.

A generalised geotechnical model of the site has been developed based on the previous geotechnical investigations undertaken at the site. The following summarises the generalised geotechnical model for the site:

- Topsoil / Silty Sand to depths ranging from 0.0 m to 0.5m;
- Very loose to loose sand to depths ranging from 0.5 m to 1.5 m;
- Medium dense sand to depths ranging from 1.5 m to 2 m;
- Indurated Sand to depths ranging from 2 m to 3 m;
- Medium dense sand to depths ranging from 3 m to 5 m; and
- Very loose to loose sand and clayey sand from 5 m to 10 m.

Although the previous Test Pits/Bores were not specifically conducted for the assessment of possible site contamination, there were no obvious indications of gross contamination (i.e. odours, staining etc.) within the logs.

Groundwater levels were recorded at depths ranging from 1.2 m to 2.0 m within the pits and bores. It should be noted that groundwater levels are affected by factors such as climatic conditions and soil permeability and will therefore vary with time

The approximate location of the test locations undertaken at the site are shown on Drawing 1 in Appendix E. Copies for previous test pits and test bores are included in Appendix A

A total of 49 ASS screening tests and five (5) detailed ASS tests were carried out on soil samples from the investigation, which indicated that 'actual' acid sulfate conditions were not present at the site in the samples tested. However the results indicated that 'potential' acid sulfate soils were present at the site up to the investigation depths (i.e. 10.5 m) and an acid sulfate soil management plan (ASSMP) is required for any excavation activities.

DP have also undertaken numerous geotechnical and environmental investigations for the adjacent residential development which indicated similar subsurface soil profile and acid sulfate potential.

5.3 Historical Title Search

A historic title deeds search was carried out by InfoTrack, the results of which are provided in Appendix C.

Reference should be made to Figure 4 for the location of the historical lots.

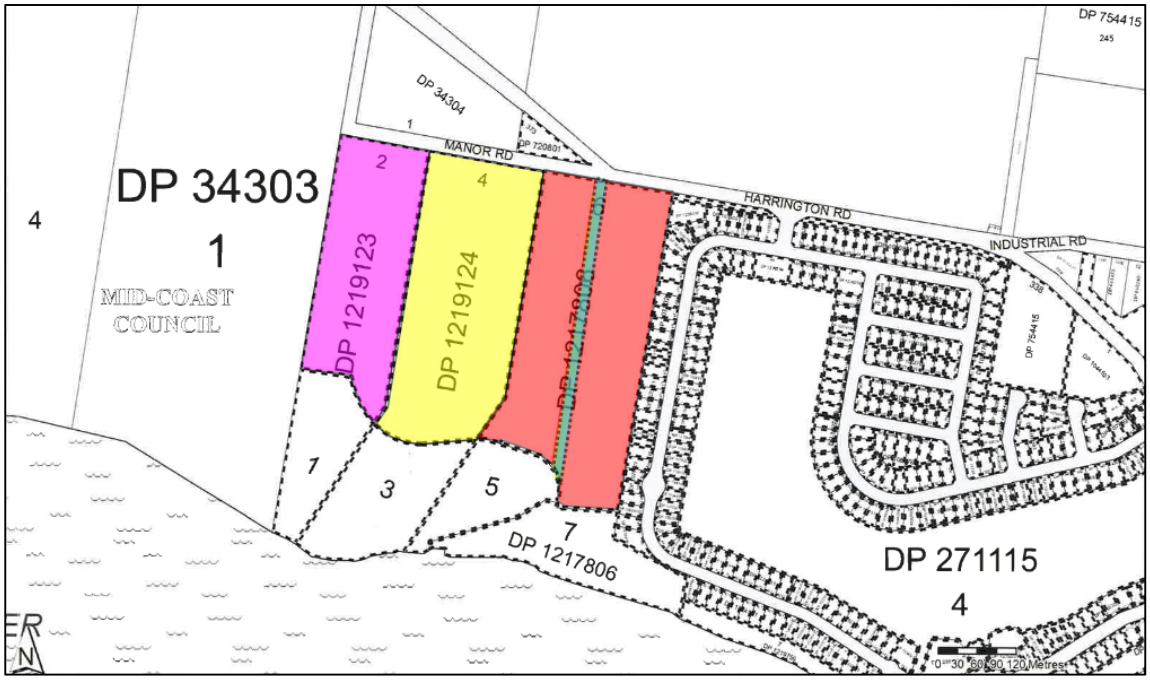

Figure 4: Historical allotment layout

The titles history of the site, shown above, is presented in Table 1 below for the western allotment (yellow shading), Table 2 for the central allotment (green shading) and Table 3 for the eastern allotment (red shading).

Table 1: Historical Title Search – Lot 2, DP1219123 – 26 Manor Road (pink shading)

Date of Acquisition and term held	Registered Proprietor(s) & Occupations where available
17.09.1902 (1902 to 1963)	Alexander Newton (Engineering Student)
28.06.1963 (1963 to 1982)	William Herbert Sheather (Dairy Farmer)
09.07.1982 (1982 to 2016)	Terence Charles Clifton Janeen Rhonda Clifton
17.12.2016 (2016 to date)	# Riverside Manors (Harrington) Pty Ltd

Notes to Table 1:
# Denotes Current Registered Proprietor

No leases were identified during the search

The following easements were found on the allotment

- Right of access (4 metres wide);
- Easement for services; and
- Easement for overhead power lines (20 metres wide).

Table 2: Historical Title Search – Lot 4, DP1219124 – 48 Manor Road (yellow shading)

Date of Acquisition and term held	Registered Proprietor(s) & Occupations where available
17.09.1902 (1902 to 1963)	Alexander Newton (Engineering Student)
28.06.1963 (1963 to 1982)	William Herbert Sheather (Dairy Farmer)
13.09.1982 (1982 to 1993)	John Andrew Clark Paul Michael Simon Peter James Callaghan
22.02.1993 (1993 to 1995)	John Andrew Clark (& his bankrupt estate)
19.12.1995 (1995 to 2016)	J & M MacDonald Pty Limited
08.12.2016 (2016 to date)	# Riverside Manors (Harrington) Pty Ltd

Notes to Table 2:
# Denotes Current Registered Proprietor

No leases were identified during the search

The following easements were found on the allotment

- Right of access (4 metres wide);
- Easement for services (variable width); and
- Easement for overhead power lines (20 metres wide).

Table 3: Historical Title Search – Lot 6, DP1217806 – 56 Manor Road (red shading)

Date of Acquisition and term held	Registered Proprietor(s) & Occupations where available
17.09.1902 (1902 to 1963)	Alexander Newton (Engineering Student)
28.06.1963 (1963 to 1984)	William Herbert Sheather (Dairy Farmer)
27.04.1984 (1984 to 2016)	Kenneth Edgar Billings Shirley Margaret Billings
29.11.2016 (2016 to 2019)	Riverside Manors (Harrington) Pty Ltd
01.04.2019 (2019 to date)	# Blue Water (Aust) Pty Ltd

Notes to Table 3:
# Denotes Current Registered Proprietor

No leases were identified during the search

The following easements were found on the allotment

- Right of access (4 metres wide);
- Easement for services (variable width);
- Right of access (5 metres wide); and
- Easement for overhead power lines (20 metres wide).

A former proposed road within Lot 6 as indicated by the green shading was purchased by William Herbert Sheather in 1969.

The title deed search indicated that the majority of the site has been used for agricultural purposes since 1963 with prior uses unknown.

There were generally no obvious indications of gross potentially contaminating activities based on the results of the title deed search.

5.3.1 Review of Historical Aerial Photos

The following historical aerial photos were reviewed for this assessment:

Table 4: Aerial Photo Review

Year	Approximate Scale	Black and White/Colour
1965	1:40,000	Black and White
1979	1:25,000	Black and White
1981	1:60,000	Black and White
1991	1:25,000	Colour
2002	1:25,000	Colour
2009	NTS	Colour
2011	NTS	Colour
2012	NTS	Colour
2015	NTS	Colour
2018	NTS	Colour

1965 Aerial Photograph

- The site appears to be undeveloped with good coverage of trees across the site;
- Harrington Road and Manor Road are present to the north of the site;
- Surrounding areas appear undeveloped;
- A track is present running from Manor Road along the approximate boundary of Lot 2 to the south to approximately half way along the lot before heading east to the approximate boundary of Lot 6 before heading south towards the Manning River.

1979 Aerial Photograph

- The site appears to be cleared of trees except along Manor Road;
- Pre existing track still present in the north of the site.

1981 Aerial Photograph

- Similar to 1979 aerial photo

1991 Aerial Photograph

- House within north western corner of Lot 2 present
- Houses along the river bank present with associated driveways from Manor Road
- Caravan park immediately to the north of Manor Road present
- Harrington Road is sealed with Manor Road unsealed.

2002 Aerial Photograph

- Similar to 1991 aerial photo;
- Further development within caravan park to the north of Manor Road is evident;
- Adjacent residential development commenced.

July 2009 Aerial Photograph

- Similar to 2002 aerial photo
- Grass appears to be brown in colour across the majority of the site with the exception of the northern part of Lot 4 and the western portion of Lot 6;
- Additional trees present across the northern part of the site;
- Above ground storage tank visible adjacent to overhead power pole within north western part of Lot 2;
- Possible stockpiles material adjacent to overhead power pole in Lot 2.

September 2011 Aerial Photograph

- Similar to 2009 aerial photo;
- Dead tree on ground adjacent to house within north western part of Lot 2
- Additional stockpiled material within north western corner of Lot 6.

March 2012 Aerial Photograph

- Similar to 2011 aerial photo;

August 2015 Aerial Photograph

- Similar to 2012 aerial photo;
- Dead tree near eastern boundary of Lot 4;

July 2018 Aerial Photograph

- Similar to 2015 aerial photo;
- A number of additional stockpiles of material to the north west and west of the house in the north western part of Lot 2;
- Large stockpile of material to the north east of the house in north western part of Lot 2;
- Other stockpiles of building and construction material present immediately adjacent to the house.

It is noted that data obtained from aerial photos was limited due to the relatively small scale and poor resolution.

5.4 NSW EPA Search

A review of the NSW EPA contaminated land management register indicated the site and immediate surrounds have no notices issued under the Contaminated Land Management Register.

A review of the list of contaminated sites notified to the NSW EPA indicated the site was not listed and immediately surrounding properties were not listed.

A search of the NSW EPA POEO Public Register indicated that there are no POEO Licences for the site, however the register did indicate a number of licences for the adjacent Harrington Waters Estate or immediately nearby properties.

Table 5: NSW EPA POEO Licences for surrounding area

Licence Number	Holder	Purpose	Status
5911	Birdon Sands Pty Ltd	Dredging	Surrendered (2001)
11373	Roche Group Pty Ltd	Dredging	Surrendered (2006)

5.5 SafeWork NSW Search

A search of the stored Chemical Information Database (SCID) and microfiche records at SafeWork NSW regarding licenses to keep dangerous goods did not reveal any records pertaining to the storage of dangerous goods on the site. A copy of the correspondence from SafeWork NSW is provided in Appendix C.

5.6 Council and Government Records Search

A search of the Mid-Coast Council website indicates that no development applications have been submitted on the allotment.

A review of the property reports from the NSW Planning and environment portal was undertaken and indicated the following:

- Lots 2 and 4 are within
  - Zone R5 – Large Lot Residential;
  - Class 3 acid sulfate soils;
- Lot 6 is within:
  - Zone R5 – Large Lot Residential and E2 – Environmental Conservation;
  - Class 2a and 3 acid sulfate soils.

Section 10.7(2) and 10.7(5) certificates were not available whilst preparing this report.

6. Site Condition

A site inspection was conducted on 7, 10 and 12 June 2019 by a senior engineer from DP. Observations made during the inspection are summarised below.

- The site generally had a good covering of grass across the majority of the site (Figure 7);
- Mature to semi mature trees along the northern boundary of the lots, sporadic coverage of trees across the rest of the site;
- Large stockpile of soil, concrete and bricks within the northern part of Lot 2 near the boundary with Lot 4 (Figure 11);
- Weatherboard house within northern part of Lot 2 (Figure 5)
- Above ground metal tank near weatherboard house (Figure 8)
- Stockpiled building and construction materials around weatherboard house, including metal scaffolding poles, bricks, tiles, weatherboard sheets (Figure 5, Figure 6 and Figure 8);
- Below ground concrete septic tank near weatherboard house (Figure 13);
- Small shed with corrugated iron sheeted roof and corrugated asbestos clad walls (Figure 9);
- Evidence of filling or previous fill stockpiles to the west of the weatherboard house with some fibro fragments (i.e. possible asbestos containing materials (ACM)) (Figure 14);
- Grass covered stockpile within Lot 6 near northern boundary;

Refer to Drawing 2 – Site Features in Appendix E for site features and location of the following photographs.

The following photos show parts of the site during the investigation.

Figure 5: View of weatherboard house and surrounding stockpiled material

Figure 6: View of stockpiled concrete fragments, bricks and tiles

Figure 7: View north east from Lot 2 eastern boundary

Figure 8: View of above ground tank and bricks

Figure 9: View of small shed with fibro sheeting (possible ACM) on walls

Figure 10: Fibro fragments around weatherboard house

Figure 11: Large stockpile of soil

Figure 12: Stockpile of soil, bricks and concrete adjacent to large stockpile

Figure 13: View of inside of concrete septic tank

Figure 14: Evidence of Fill and possible ACM fragment

Approximate locations and orientation of photos are shown on Drawing 2 in Appendix E.

7. Potential Contaminants

Based on the available site history information and observations made during the site inspection, the principal on-site sources of potential contamination are considered to be:

- Imported filling within the northern part of Lot 2 and Lot 6, which may contain a range of contaminants depending on the source;
- Presence of stored building materials and other imported materials over unsealed areas of the site;
- Existing structures containing possible hazardous building materials including ACM (i.e. possible damage to cladding/materials);
- Possible hydrocarbon impact from leaking aboveground service tanks (AGST) within northern part of Lot 2;
- Possible pesticide, heavy metal, hydrocarbon impacts from pesticide / herbicide application;
- Possible leaks/migration from onsite septic system.

The risk of gross contamination from off-site land uses is generally considered to be low due to the local topography, the neighbouring residential properties and previous surrounding land uses.

8. Conceptual Site Model

A conceptual site model (CSM) has been prepared for the investigation area with reference to the National Environment Protection (Assessment of Site Contamination) Measure 1999 amended 2013 Schedule B2 (NEPC, 2013). The CSM identifies potential contaminant sources and contaminants of concern, contaminant release mechanisms, exposure pathways and potential receptors.

Table 6: Conceptual Site Model

Known and Potential Primary Sources	Primary Release Mechanism	Secondary Release Mechanism	Potential Impacted Media	Contaminants of Concern	Exposure Pathway	Potential Receptors	
						Current	Future
Possible imported filling and stored building materials within the site (source unknown)	Placement of filling on-site	Long-term leaching of contaminants via runoff, rain water infiltration / percolation or exposure/disturbance during proposed development	Soil, groundwater, surface water	TRH, BTEX, PAH, Metals, Pesticides, PCB, OCP/OPP, asbestos	Dermal contact, inhalation (dust/vapours), ingestion	Site users, site workers, Consultants, trespassers, surface water bodies, groundwater, neighbouring properties	Potential site users, site workers, maintenance workers, construction workers, consultants, trespassers, surface water bodies, neighbouring properties, groundwater
Hazardous building materials (HBM), including ACM	Possible demolition or damage to existing structures containing HBM including ACM	Exposure/disturbance during proposed development	Soil, groundwater, surface water	Asbestos, PCB, metals	Dermal contact, inhalation (dust/vapours), ingestion		
Possible pesticide use	Spraying of weeds/pests and/or spills/leaks from stored pesticides	Long-term leaching of contaminants via runoff, rain water infiltration / percolation through soil, exposure/disturbance during proposed development	Soil, groundwater, surface water	OCP, OPP, TRH, PAH, Metals	Dermal contact, inhalation (dust/vapours), ingestion		
Possible Hydrocarbon Contamination from above ground storage tank	Leakage from tank, spills during refuelling	Long term deterioration of metal tank. Long-term leaching of contaminants via runoff, rain water infiltration / percolation or exposure/disturbance during proposed development	Soil, groundwater, surface water	PAH, TRH, BTEX, metals	Dermal contact, inhalation (dust/vapours), ingestion		
On-site septic system	Leakage from system	Long-term leaching of contaminants via runoff, rain water infiltration / percolation or exposure/disturbance during proposed development	Soil, groundwater, surface water	Nutrients, microbiological impacts, hydrocarbons, Metals,	Dermal contact, inhalation (dust/vapours), ingestion		

Notes to Table 6
Heavy Metals = arsenic, cadmium, chromium, copper, lead, mercury, nickel, zinc
TRH = total recoverable hydrocarbons, BTEX – benzene, Toluene, ethyl benzene and xylene
PAH = polycyclic aromatic hydrocarbons, PCB = polychlorinated biphenyls
OCP = organochlorine pesticides OPP = organophosphorus pesticides

9. Field Work

9.1 Methods

Limited field work was undertaken on the 10 June 2019 and comprised the following:

- Collection of three near surface soil samples at targeted locations;
- Collection of two possible asbestos samples and surrounding soil samples

The approximate sample locations are shown on Drawing 1 in Appendix E along with the previous test locations.

The field work and sampling was undertaken by a senior engineer from DP.

It is noted that an accurate survey was not conducted for this investigation. The locations of the samples were recorded using a hand held GPS which are typically accurate to ±5 m depending on satellite coverage. Sample locations are therefore approximate only. Test locations from the previous investigation where however surveyed by the project surveyors to Map Grid of Australia (MGA). The location and surface levels of the pits and bores from the previous investigation are presented on the logs in Appendix A.

9.2 Sampling Rationale

Potential sources of site contamination identified in the CSM included imported filling (source unknown), hazardous building materials, possible hydrocarbon and possible pesticides application.

A judgemental sampling procedure was conducted for the preliminary investigation to target the following potential contamination sources:

- Possible area of filling – Location 301;
- Possible hydrocarbon contamination – Location 303; and
- Possible pesticide use – Location 302.

Samples were selected for analysis on the basis of the likely presence of contamination, based on visual evidence of possible contamination (i.e. asbestos or evidence of filling), and proximity to a known source of contamination.

It is noted that the site comprises an area of approximately 23 ha. The three targeted locations undertaken within the investigation area provided preliminary assessment of conditions at the locations tested only.

It is noted that the preliminary contamination assessment has not included an assessment of groundwater.

9.3 Sampling Methods

Near surface soil samples for contamination testing were collected with reference to environmental sampling protocols. Soil samples were collected directly by hand, using disposable new gloves or stainless steel sampling equipment. Care was taken to remove any extraneous material deposited on the sample.

The general sampling procedure comprised:

- Decontamination of all sampling equipment (where used) using a 3% solution of phosphate free detergent (Decon 90) and tap water prior to collecting each sample;
- The use of new disposable gloves for each sampling event;
- Transfer of samples into laboratory-prepared jars and capping immediately;
- Collection of replicate samples for Quality Assurance / Quality Control (QA / QC) purposes;
- Collection of replicate soil samples in zip-lock plastic bags at each depth for Photo-ionisation Detector (PID) screening;
- Collection of ASS samples in plastic wrap and plastic bags to exclude air;
- Labelling of sample containers with individual and unique identification, including project number, sample location and sample depth;
- Placement of the sample jars, ASS samples and replicate sample bags into a cooled, insulated and sealed container with ice for transport to the laboratory; and
- Use of chain of custody (C-O-C) documentation ensuring that sample tracking and custody could be cross-checked at any point in the transfer of samples from the field to the laboratory. Copies of the completed forms are provided in Appendix B.

Following each test bore, the augers were decontaminated using tap water and phosphate free detergent (Decon 90) to minimise the potential for cross contamination.

Replicate samples collected in zip-lock bags were screened for the presence of volatile organic compounds (VOCs) using a calibrated MiniRAE Lite PID, with a 10.6 eV lamp, calibrated to 100 ppm Isobutylene.

9.4 Data Quality Objectives (DQOs)

The scope of the PSI was devised generally in accordance with the seven step data quality objective (DQO) process, as documented in Appendix C, Schedule B2, National Environmental Protection Council (NEPC) National Environmental Protection (Assessment of Site Contamination) Measure 2013 (NEPC 2013). The DQO process is outlined in Table 7.

Table 7: Data Quality Objectives

DQO	Achievement Evaluation Procedure
Step 1 – State the problem	Possible presence of contamination
Step 2 – Identify the decision	Assess whether the site is suitable for the intended land use from a contamination perspective Refer Section 11 for adopted site assessment criteria
Step 3 - Identify the inputs to the decision	Site history review from previous investigation/s Selection of appropriate contaminants of concern Field and laboratory QA/QC data to assess the suitability of the environmental data for the assessment
Step 4 – Define the Boundary of the Assessment	As defined in Section 2 and shown on Drawing 1 in Appendix E.
Step 5 – Develop of decision rule	Selected soil samples were analysed for the contaminants of concern as outlined in Section 8. The field and laboratory data was assessed as reliable by reference to the Data Quality Indicators (DQI) as outlined in Step 7.
Step 6 – Specify the acceptance criteria	The site assessment criteria was developed through reference to NEPC 1999 (amended 2013). The acceptance limits for laboratory QA/QC parameters were based on the laboratory reported acceptance limits and those stated in NEPC 2013.
Step 7 – Optimise the design for obtaining data	Design was optimised by the development of a plan for sample collection, handling and analysis, including undertaking quality assurance and quality control measures to allow assessment of the suitability of the data collected. Measurement to assess the project DQOs using data quality indicators (DQIs) as follows: Completeness – completion of field and laboratory chain of custody documentation, use of experienced field staff, compliance with holding times and documentation correct Comparability – consistent sampling procedures, use of NATA certified laboratory and experienced field staff Representativeness – appropriate media sampled Precision - Analysis of field and laboratory replicates and achievement of acceptable RPDs, acceptable levels for laboratory QC criteria Accuracy – Analysis of field duplicates, matrix spikes and surrogate spikes

9.5 Field QA / QC

Quality assurance (QA) and quality control (QC) procedures were adopted throughout the field sampling programme and comprised the following:

- Following standard operating procedures;
- Storage of samples under secure, temperature controlled conditions; and
- Use of chain of custody documentation for the handling, transport and delivery of samples to the selected laboratory.

9.6 Laboratory QA/QC

The NATA accredited chemical laboratories undertook in-house QA/QC procedures involving the routine testing of:

- Reagent blanks;
- Spike recovery analysis;
- Laboratory duplicate analysis;
- Analysis of control standards;
- Calibration standards and blanks; and
- Statistical analysis of QC data.

9.7 Contamination Observations

Observations of potential contamination across the site is summarised below in Table 8.

Table 8: Potential Contaminant Observations within Test locations

Potential Contaminant Observation	Observations
Filling	Stockpiled materials
Anthropogenic inclusions (Glass, Steel, Plastic)	Stockpiled materials
Possible Asbestos Containing Material – Fibro fragments	Fibro sheeting on small shed and fragments observed near surface around potential filled areas

PID screening generally indicated the absence of gross volatile hydrocarbon impact (PID <1 ppm) in the samples screened.

There was no visual or olfactory evidence (i.e. staining or odours) to suggest the presence of gross contamination within the soils investigated to the depths investigated (i.e. <0.1 m depth).

10. Proposed Development

It is understood that an eleven (11) stage subdivision is proposed for the site which covers an area of approximately 23 hectares and will include the following:

- 292 residential allotments;
- Upgrade of Manor Road to include kerb and guttering, approximately 380 m in length;
- Approximately 4 km of internal roadways;
- Car parking and caravan storage;
- Wetland areas adjacent to Manor Road;
- Proposed detention basins;
- Sewer pump station;
- Village green including retail shops, short term accommodation and rec centre; and
- Tennis courts, club house, gym, bowling green and a Mens shed.

It is further understood that approximately 150,000 m^3 of fill is proposed to be brought to the site to raise the surface level above the flood zone. The filling is proposed to raise the surface by up to 1.5 m.

11. Site Assessment Criteria

11.1 Introduction

The proposed development includes residential land use.

The assessment and characterisation of the material on the site and the results of laboratory testing have been compared to the following guidelines:

- National Environmental Protection Council (NEPC), 'National Environmental Protection (Assessment of Site Contamination) Measures' (NEPM), 1999 (amended 2013) (NEPC, 2013); and
- NSW EPA, 'Waste Classification Guidelines, Part 1: Classifying Waste', November 2014 (EPA, 2014a).

The investigation and screening levels applied in the current investigation comprise levels adopted for a generic residential with garden / accessible soil use scenario (HIL-A).

11.2 Health Investigation and Screening Levels

The generic health investigation levels (HIL) and health screening levels (HSL) are considered to be appropriate for the assessment of contamination at the site. The adopted soil HIL and HSL for the potential contaminants of concern are presented in Table 9.

Table 9: HIL and HSL in mg/kg Unless Otherwise Indicated

Contaminants		HIL-A	HSL-A[4] Vapour Intrusion	HSL-A[5] Direct Contact
Metals	Arsenic	100	NC	NC
	Cadmium	20	NC	NC
	Chromium (VI)	100	NC	NC
	Copper	6,000	NC	NC
	Lead	300	NC	NC
	Mercury (inorganic)	40	NC	NC
	Nickel	400	NC	NC
	Zinc	7,400	NC	NC
PAH	Benzo(a)pyrene TEQ[1]	3	NC	NC
	Naphthalene	3	NL	1,400
	Total PAH	300	NC	NC
TRH	C6 – C10 (less BTEX) [F1]	NC	200	4,400
	>C10-C16 (less Naphthalene) [F2]	NC	NL	3,300
	>C16-C34 [F3]	NC	NC	4,500
	>C34-C40 [F4]	NC	NC	6,300
BTEX	Benzene	0.5	0.5	100
	Toluene	160	540	14,000
	Ethylbenzene	55	NL	4,500
	Xylenes	40	170	12,000
OCP	Aldrin + Dieldrin	6	NC	NC
	Chlordane	50	NC	NC
	DDT+DDE+DDD	240	NC	NC
	Endosulfan	2,700	NC	NC
	Endrin	10	NC	NC
	Heptachlor	6	NC	NC
	HCB	10	NC	NC
	Methoxychlor	300	NC	NC
OPP	Chlorpyrifos	160	NC	NC
PCB[2]		1	NC	NC

Notes to Table 9:

1 Sum of carcinogenic PAHs

2 Non dioxin-like PCBs only.

3 The soil saturation concentration (Csat) is defined as the soil concentration at which the porewater phase cannot dissolve any more of an individual chemical. The soil vapour that is in equilibrium with the porewater will be at its maximum. If the derived soil HSL exceeds Csat, a soil vapour source concentration for a petroleum mixture could not exceed a level that would results in the maximum allowable vapour risk for the given scenario. For these scenarios, no HSL is presented for these chemicals and the HSL is shown as 'not limiting' or 'NL'.

4 The HSL have been calculated for a potential vapour intrusion pathway, a conservative sand soil (based on nature of filling) and an assumed depth to contamination of 0 m to <1 .

5 The HSL have been calculated for the direct contact pathway

NC – No Criteria.

As shown in Table 9 the HSLs for potential vapour intrusion pathways are non-limiting, due to the land use type (i.e. open space). For this reason, the adopted HSLs are predicated on a potential direct contact pathway identified in the CSM and are therefore the drivers for further assessment and / or remediation (if required).

11.3 Ecological Investigation Levels

EIL and Added Contaminant Limits (ACLs), where appropriate, have been derived in NEPC (2013) for only a short list of contaminants comprising As, Cu, Cr (III), DDT, naphthalene, Ni, Pb and Zn. The adopted EIL, derived using the *Interactive (Excel) Calculation Spreadsheet* (Standing Council on Environment and Water (SCEW) website (http://www.scew.gov.au/node/941)) are shown in the following Table 10.

Table 10: EIL in mg/kg

Analyte		EIL	Comments
		Residential	
Metals	Arsenic	100	**Adopted parameters** pH = 5 (based on laboratory testing) CEC = 5 $cmol_c$/kg]; assumed clay content [5%] Organic content 1% 'Aged' (>2 years) source of contamination Low traffic volumes in NSW
	Cadmium	NC	
	Chromium III	320	
	Copper	100	
	Nickel	35	
	Lead	1,100	
	Mercury	NC	
	Zinc	210	
PAH	Naphthalene	170	
OCP	DDT	320	

11.4 Ecological Screening Levels

ESL are used to assess the risk of selected petroleum hydrocarbon compounds, BTEX and benzo(a)pyrene to terrestrial ecosystems. The adopted ESL are shown in the following Table 11.

Table 11: ESL in mg/kg

Analyte		ESL (Residential)[1]
TRH	C6 – C10 (less BTEX) [F1]	180
	>C10-C16 (less Naphthalene) [F2]	120
	>C16-C34 [F3]	300
	>C34-C40 [F4]	2,800
BTEX	Benzene	50
	Toluene	85
	Ethylbenzene	70
	Xylenes	105
PAH	Benzo(a)pyrene	0.7

Notes to Table 11:

1. The ESL have been calculated for a coarse soil based on a conservative sand soil and recreational landuse.

11.5 Management Limits

In addition to appropriate consideration and application of the HSL and ESL, there are additional considerations which reflect the nature and properties of petroleum hydrocarbons, including:

- Formation of observable light non-aqueous phase liquids (LNAPL);
- Fire and explosion hazards;
- Effects on buried infrastructure e.g. penetration of, or damage to, in-ground services.

The adopted management limits from Schedule B1 of NEPC (2013) are shown in the following Table 12.

Table 12: Management Limits in mg/kg

Analyte		Management Limit	Comments
TRH	$C_6 - C_{10}$ (F1)#	700	The management limits have been calculated for a conservative coarse sand and residential landuse
	$>C_{10}$-C_{16} (F2)#	1,000	
	$>C_{16}$-C_{34} (F3)	2,500	
	$>C_{34}$-C_{40} (F4)	10,000	

Notes to Table 12:

Separate management limits for BTEX and naphthalene are not available hence these have not been subtracted from the relevant fractions to obtain F1 and F2

11.6 Asbestos in Soil

Asbestos only poses a risk to human health when asbestos fibres are made airborne and inhaled. If asbestos is bound in a matrix such as cement or resin, it is not readily made airborne except through substantial physical damage. Bonded ACM in sound condition represents a low human health risk, whilst both Fibrous Asbestos (FA) and Asbestos Fines (AF) materials have the potential to generate, or be associated with, free asbestos fibres. Consequently, FA and AF must be carefully managed to prevent the release of asbestos fibres into the air.

A detailed asbestos assessment was not undertaken as part of these works. Therefore the presence or absence of asbestos at a limit of reporting of 0.1 g/kg has been adopted for this assessment as an initial screen.

11.7 Waste Classification

The results of chemical testing were also compared against NSW EPA Waste Classification Guidelines (EPA, 2014a) for a preliminary assessment of possible off-site disposal options to a licenced facility. For comparison purposes the results were also compared to NSW EPA Excavated Natural Material (ENM) criteria (EPA, 2014b).

12. Laboratory Testing

Laboratory testing for the preliminary investigation was undertaken by Envirolab Services, a National Association of Testing Authorities, Australia (NATA) registered laboratory. Analytical Methods used are shown on the laboratory sheets in Appendix B.

12.1 Contamination Testing

A total of three soil samples were selected for analysis for the following potential contaminants:

- Metals (Arsenic, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Zinc);
- Total Recoverable Hydrocarbons (TRH);
- Benzene, Toluene, Ethylbenzene, Xylene (BTEX);
- Polycyclic Aromatic Hydrocarbons (PAH);
- Polychlorinated Biphenyls (PCBs);
- Organochlorine (OCP) and Organophosphate (OPP) Pesticides; and
- Asbestos Identification.

An additional three samples were submitted for asbestos ID testing with two samples of possible asbestos sheeting fragments and a soil sample collected immediately beneath a fragment.

The detailed results of chemical analysis on the tested samples are presented in the laboratory report sheets in Appendix B, and are summarised in Table 13 to Table 16, below.

Based on a review of the report QC results, it is considered that the laboratory test data obtained are reliable and useable for this assessment. The results of QA/QC testing are presented in Appendix B.

Table 13: Laboratory Results for Metals in Soil

Location	Depth (m)	Fill (F) / Natural (N)	PID (ppm)	As	Cd	Cr	Cu	Pb	Hg	Ni	Zn

305	65 x 48 x 6	Beige layered fibre cement material	No asbestos detected

12.2 Acid Sulfate Screening Tests

Acid sulfate soil screening tests were undertaken during a previous investigation by DP at the site. Testing for the preliminary ASS investigation comprised 49 acid sulfate screening tests on samples retrieved from the bores. The results of the previous screening tests are summarised in Table 18.

Table 18: Acid Sulfate Soil Screening Tests

ASSMAC Indicators		Coarse sands, poorly buffered		<4[c]	<3.5[d]	≥1[d]
		Coarse sands to loamy sands and peats				
		Medium sandy loams to light clays				
		Fine medium to heavy clays & silty clays				

Legend:

a Depth below ground surface

b Strength of Reaction

1 denotes no or slight reaction

2 denotes moderate reaction

3 denotes high reaction

4 denotes very vigorous reaction

F denotes bubbling/frothy reaction indicative of organics

H denotes heat generated

C denotes colour change

Bold notates exceedance of net acidity action criteria or ASSMAC indicator

c For actual acid sulphate soils (ASS)

d Indicative value only for Potential Acid Sulphate Soils (PASS)

Based on the results of the screening tests, six samples were selected and forwarded to ALS Environmental Pty Ltd to undergo Total Actual Acidity (TAA), Total Potential Acidity (TPA) and Chromium Reducible Sulphur (Scr) testing. The results of these tests are summarised in Table 19, with the laboratory testing certificate provided in Appendix B

Table 19: Results of Detailed Acid Sulfate Soil Testing

Bore	Depth[(1)] (m)	RL (m, AHD)	Description	pH_{KCL}	TPA (mol H^+/t)	TAA (mol H^+/t)	Scr (%)
1	7.0 – 7.45	-4.5 to -4.9	Clayey Sand	4.4	180	6	0.27
2	7.00 – 7.45	-4.5 to -4.9	Clayey Sand	4.4	123	6	0.23
3	0.2	2.3	Topsoil – Silty Sand	4.4	26	8	<0.02
3	7.00 – 7.45	-4.5 to -4.9	Sand	4.2	169	8	0.35
7	4.00 – 4.45	-1.9 to -2.2	Sand	4.5	156	15	0.22
Action criteria for sand (course texture)					18	18	0.03
Action criteria for sandy loams to light clays (medium texture)[(2)]					36	36	0.06

Notes to Table 19:
Shaded samples exceed ASSMAC action criteria (ASSMAC, 1998)
(1) Depth below existing ground level
(2) Action criteria level assuming that less than 1000 m3 to be excavated at one time

13. Comments

13.1 Acid Sulfate Soil

The QASSIT guidelines suggest that a soil pH<4 in water (i.e. pH_F) is an indicator of actual acid sulfate soils. The results of screening tests therefore suggest the absence of actual acid sulfate soils at the locations and depths tested.

The QASSIT guidelines also suggest that indicators of potential acid sulfate soils (PASS) include the following:

- Soil pH <3.5 in H_2O_2 (i.e. pH_{FOX}); and
- Drop of 1 pH unit or more between pH_F and pH_{FOX}.

The majority of the samples tested (39) exhibited a pH drop of greater than one unit, however 22 soil samples exhibited a pH below 3.5 following oxidation.

It is noted that the above test method is a qualitative method only and gives an indication of the intensity of total acidification (pH). The ASSMAC guidelines indicate that peroxide may also oxidise organic matter (in addition to pyrite) to produce acids which are unlikely to form under natural conditions, thus giving falsely high indication of acid sulfate potential.

Quantitative results are obtained from laboratory testing by either Suspension Peroxide Oxidation Combined Acidity and Sulfate (SPOCAS) or Chromium reducible sulfur (S_{Cr}) methods. Detailed laboratory testing was carried out on five samples that exceeded the above indicators of acid sulfate soils. The results of these tests are presented in Table 19, Section 12.2.

As outlined in *The Soil Management Guidelines* (Dear, et al., 2014) the action criteria which define the requirement for management of acid sulfate soils vary depending on the amount of soil disturbed and textural classification of the soil.

The results of detailed laboratory analysis confirm that actual acid sulfate soils are not present within the samples tested within the site. However, the results of TPA or %SCr exceed the ASSMAC action criteria (ASSMAC, 1998) for most samples, and is marginal for the topsoil material, and therefore indicate the presence of potential acid sulfate soils (PASS) across the majority of the site.

The results of the acid sulfate soil testing indicates that potential acid sulfate soils (PASS) are generally present in the underlying soils below depths of about 1 m (i.e. below groundwater). The topsoil material does not constitute a significant risk of generating acid upon oxidation.

It is understood that the only excavations at the site are expected to be associated with installation of services and stripping of topsoil prior to placement of filling. An Acid Sulfate Soil Management Plan (ASSMP) is being prepared for the proposed development and will be presented in a separate report. The ASSMP will include details on construction activities involving excavation or possible dewatering and the treatment of acid sulfate soils.

13.2 Contamination Assessment

13.2.1 Contamination Status

The results of the site history review suggested the general absence of gross contaminating landuses or activities for the site, other than historically recent storage of construction materials/waste, former agricultural landuse and the presence of imported filling (source unknown).

The current preliminary assessment comprised collection of near surface samples at limited targeted locations.

The current preliminary assessment comprised the collection of near surface soil samples and fibro fragments at targeted locations across the site.
Three soil samples were analysed for the suite of testing outlined in Section 12 for the current preliminary investigation. The results of testing were compared against NEPM for health based investigation / screening levels, ecological investigation / screening levels, total petroleum hydrocarbon management limits for low density residential landuse applicable for urban residential as discussed in Section 11.

All samples tested were below the relevant criteria for the health investigation and screening levels, and environmental investigation and screening levels for the adopted low density residential landuse.

All samples tested returned contaminant concentrations below the total petroleum hydrocarbon management limits.

The laboratory results were generally consistent with the visual and olfactory ‘screening’ that suggested the absence of gross contamination within the test locations.

Hazardous building materials (HBM) including asbestos, were observed at the surface on the site or on existing structures at the site. Laboratory testing undertaken on collected samples indicated the presence of asbestos to the laboratory reporting limits within one of the samples analysed. Owing to the presence of fill/anthropogenic inclusions and historical demolition activities at the site, there is a risk of HBM (including ACM) in unobserved or untested parts of the site.

No assessment of groundwater was undertaken for the preliminary investigation.

13.2.2 Conclusions

The results of limited testing generally indicated the absence of gross chemical contamination at the near surface locations tested. All samples tested returned contaminant concentrations below the adopted health based investigation / screening levels, ecological investigation / screening levels, total petroleum hydrocarbon management limits for the adopted low density residential land use (refer to Section 11).

Based on the results of the preliminary investigation the site is considered to be suitable for the proposed development from a contamination perspective subject to the following, which should be undertaken prior to the commencement of earthworks construction:

- Additional targeted testing and sampling of fill materials across the site where present to confirm the presence/absence of impacts including HBM. Requirements for remediation/management (if any) would be confirmed following the additional investigation;
- Additional testing over the site to confirm the presence/absence of herbicides and pesticides from previous farm/agricultural site use;
- Appropriate decommissioning of site septic system;
- Incorporation of an unexpected finds protocols into the Construction Environmental Management Plan (CEMP) for the development given the presence of filling of unknown origin and possible previous demolition activities.

If additional investigation identifies the presence of contamination requiring remediation/management, remediation and validation of the site should be conducted in accordance with a site specific remediation action plan (RAP).

It is noted that fill materials have been identified within the site (source unknown) together with the presence of anthropogenic inclusions which are considered to be typical of the presence of demolition waste and hazardous building materials (including asbestos containing materials). Additional assessment is therefore recommended to better characterise site conditions. An unexpected finds protocol is also recommended during development to manage this risk.

13.2.3 Preliminary Waste Classification

Based on the site historical information, site investigations and limited laboratory testing the following waste classifications comments are provided:

Existing Filling/Topsoil where tested

- Generally classified as General Solid Waste (GSW) with reference to NSW EPA Waste Classification guidelines (EPA, 2014a).
- Fill materials tested are generally not classified as Excavated Natural Materials (ENM) due to total contaminant concentrations and presence of anthropogenic inclusions. It is noted that the preliminary sampling and testing conducted to date does not meet the requirements of the NSW EPA ENM RRO.
- Although the risk of ASS in filling is considered to be low, ASS conditions should be confirmed prior to disposal or reuse of the soils. Treatment of ASS will be required prior to disposal if ASS are identified.

Materials proposed to be disposed from the site during development should be appropriately classified with reference to NSW EPA Waste Classification guidelines (EPA, 2014a).

During development, it is recommended that appropriate inspections are conducted and if any materials are encountered that are different to the materials sampled and tested or exhibit signs of contamination (e.g. anthropogenic inclusions, fibro fragments, staining or odours etc.), these should be appropriately segregated for further assessment. The handling, transport and disposal / re-use of the materials should be conducted in accordance with regulatory and statutory requirements.

Underlying Natural Soils

Owing to the preliminary nature of the investigation no sampling and testing has been undertaken on underlying natural soils. Underlying natural material won from site excavations (i.e. sandy materials) would likely satisfy the criteria for Virgin Excavated Natural Material (VENM) subject to appropriate segregation and validation from upper fill materials and further assessment to confirm the absence of ASS conditions. Natural soils classified as ASS cannot be classified as VENM.

It is noted that the scope of testing was intended to provide a preliminary indication of contaminant concentrations and waste classification at nominated test locations. The scope of work does not meet the sampling density and testing requirements for classification of fill materials with reference to the NSW EPA ENM RRO (EPA, 2014b), nor the sampling density requirements of the NSW EPA Sampling design guidelines for site characterisation (EPA, 1995).

15. Limitations

Douglas Partners (DP) has prepared this report for this project at 26, 48 and 56 Manor Road, Harrington with reference to DP's proposal PMQ190028 dated 31 May 2019 and acceptance received from Danny Bayly dated 3 June 2019. The work was carried out under DP's Conditions of Engagement. This report is provided for the exclusive use of Bayline Homes and Developments Pty Ltd for this project only and for the purposes as described in the report. It should not be used by or relied upon for other projects or purposes on the same or other site or by a third party. Any party so relying upon this report beyond its exclusive use and purpose as stated above, and without the express written consent of DP, does so entirely at its own risk and without recourse to DP for any loss or damage. In preparing this report DP has necessarily relied upon information provided by the client and/or their agents.

The results provided in the report are indicative of the sub-surface conditions on the site only at the specific sampling and/or testing locations, and then only to the depths investigated and at the time the work was carried out. Sub-surface conditions can change abruptly due to variable geological processes and also as a result of human influences. Such changes may occur after DP's field testing has been completed. It is noted that limited sampling and testing was conducted on selected near surface soils. Additional testing will be required to confirm site conditions, as recommended.

DP's advice is based upon the conditions encountered during this investigation. The accuracy of the advice provided by DP in this report may be affected by undetected variations in ground conditions across the site between and beyond the sampling and/or testing locations. The advice may also be limited by budget constraints imposed by others or by site accessibility.

This report must be read in conjunction with all of the attached and should be kept in its entirety without separation of individual pages or sections. DP cannot be held responsible for interpretations or conclusions made by others unless they are supported by an expressed statement, interpretation, outcome or conclusion stated in this report.

This report, or sections from this report, should not be used as part of a specification for a project, without review and agreement by DP. This is because this report has been written as advice and opinion rather than instructions for construction.

Asbestos has been detected by observation and by laboratory analysis, either on the surface of the site, or in fill materials at the test locations sampled and analysed. Building demolition materials, such as concrete, brick, tile, fibro sheeting, were, however, located in previous and current above-ground stockpiles, and these are considered as indicative of the possible presence of hazardous building materials (HBM), including asbestos.

Although the sampling plan adopted for this investigation is considered appropriate to achieve the stated project objectives, there are necessarily parts of the site that have not been sampled and analysed. This is either due to undetected variations in ground conditions or to budget constraints (as discussed above), or to vegetation preventing visual inspection and reasonable access. It is therefore considered possible that HBM, including asbestos, may be present in unobserved or untested parts of the site, between and beyond sampling locations, and hence no warranty can be given that asbestos is not present.

The contents of this report do not constitute formal design components such as are required, by the Health and Safety Legislation and Regulations, to be included in a Safety Report specifying the hazards likely to be encountered during construction and the controls required to mitigate risk. This design process requires risk assessment to be undertaken, with such assessment being dependent upon factors relating to likelihood of occurrence and consequences of damage to property and to life. This, in turn, requires project data and analysis presently beyond the knowledge and project role respectively of DP. DP may be able, however, to assist the client in carrying out a risk assessment of potential hazards contained in the Comments section of this report, as an extension to the current scope of works, if so requested, and provided that suitable additional information is made available to DP. Any such risk assessment would, however, be necessarily restricted to the environmental components set out in this report and to their application by the project designers to project design, construction, maintenance and demolition.

About this Report

Douglas Partners

Introduction

These notes have been provided to amplify DP's report in regard to classification methods, field procedures and the comments section. Not all are necessarily relevant to all reports.

DP's reports are based on information gained from limited subsurface excavations and sampling, supplemented by knowledge of local geology and experience. For this reason, they must be regarded as interpretive rather than factual documents, limited to some extent by the scope of information on which they rely.

Copyright

Borehole and Test Pit Logs

The borehole and test pit logs presented in this report are an engineering and/or geological interpretation of the subsurface conditions, and their reliability will depend to some extent on frequency of sampling and the method of drilling or excavation. Ideally, continuous undisturbed sampling or core drilling will provide the most reliable assessment, but this is not always practicable or possible to justify on economic grounds. In any case the boreholes and test pits represent only a very small sample of the total subsurface profile.

Interpretation of the information and its application to design and construction should therefore take into account the spacing of boreholes or pits, the frequency of sampling, and the possibility of other than 'straight line' variations between the test locations.

Groundwater

Where groundwater levels are measured in boreholes there are several potential problems, namely:

- In low permeability soils groundwater may enter the hole very slowly or perhaps not at all during the time the hole is left open;
- A localised, perched water table may lead to an erroneous indication of the true water table;
- Water table levels will vary from time to time with seasons or recent weather changes. They may not be the same at the time of construction as are indicated in the report; and
- The use of water or mud as a drilling fluid will mask any groundwater inflow. Water has to be blown out of the hole and drilling mud must first be washed out of the hole if water measurements are to be made.

More reliable measurements can be made by installing standpipes which are read at intervals over several days, or perhaps weeks for low permeability soils. Piezometers, sealed in a particular stratum, may be advisable in low permeability soils or where there may be interference from a perched water table.

Reports

The report has been prepared by qualified personnel, is based on the information obtained from field and laboratory testing, and has been undertaken to current engineering standards of interpretation and analysis. Where the report has been prepared for a specific design proposal, the information and interpretation may not be relevant if the design proposal is changed. If this happens, DP will be pleased to review the report and the sufficiency of the investigation work.

Every care is taken with the report as it relates to interpretation of subsurface conditions, discussion of geotechnical and environmental aspects, and recommendations or suggestions for design and construction. However, DP cannot always anticipate or assume responsibility for:

- Unexpected variations in ground conditions. The potential for this will depend partly on borehole or pit spacing and sampling frequency;
- Changes in policy or interpretations of policy by statutory authorities; or
- The actions of contractors responding to commercial pressures.

If these occur, DP will be pleased to assist with investigations or advice to resolve the matter.

About this Report

Site Anomalies

In the event that conditions encountered on site during construction appear to vary from those which were expected from the information contained in the report, DP requests that it be immediately notified. Most problems are much more readily resolved when conditions are exposed rather than at some later stage, well after the event.

Information for Contractual Purposes

Where information obtained from this report is provided for tendering purposes, it is recommended that all information, including the written report and discussion, be made available. In circumstances where the discussion or comments section is not relevant to the contractual situation, it may be appropriate to prepare a specially edited document. DP would be pleased to assist in this regard and/or to make additional report copies available for contract purposes at a nominal charge.

Site Inspection

The company will always be pleased to provide engineering inspection services for geotechnical and environmental aspects of work to which this report is related. This could range from a site visit to confirm that conditions exposed are as expected, to full time engineering presence on site.

Sampling

Sampling is carried out during drilling or test pitting to allow engineering examination (and laboratory testing where required) of the soil or rock.

Disturbed samples taken during drilling provide information on colour, type, inclusions and, depending upon the degree of disturbance, some information on strength and structure.

Undisturbed samples are taken by pushing a thin-walled sample tube into the soil and withdrawing it to obtain a sample of the soil in a relatively undisturbed state. Such samples yield information on structure and strength, and are necessary for laboratory determination of shear strength and compressibility. Undisturbed sampling is generally effective only in cohesive soils.

Test Pits

Test pits are usually excavated with a backhoe or an excavator, allowing close examination of the in-situ soil if it is safe to enter into the pit. The depth of excavation is limited to about 3 m for a backhoe and up to 6 m for a large excavator. A potential disadvantage of this investigation method is the larger area of disturbance to the site.

Large Diameter Augers

Boreholes can be drilled using a rotating plate or short spiral auger, generally 300 mm or larger in diameter commonly mounted on a standard piling rig. The cuttings are returned to the surface at intervals (generally not more than 0.5 m) and are disturbed but usually unchanged in moisture content. Identification of soil strata is generally much more reliable than with continuous spiral flight augers, and is usually supplemented by occasional undisturbed tube samples.

Continuous Spiral Flight Augers

The borehole is advanced using 90-115 mm diameter continuous spiral flight augers which are withdrawn at intervals to allow sampling or in-situ testing. This is a relatively economical means of drilling in clays and sands above the water table. Samples are returned to the surface, or may be collected after withdrawal of the auger flights, but they are disturbed and may be mixed with soils from the sides of the hole. Information from the drilling (as distinct from specific sampling by SPTs or undisturbed samples) is of relatively low reliability, due to the remoulding, possible mixing or softening of samples by groundwater.

Non-core Rotary Drilling

The borehole is advanced using a rotary bit, with water or drilling mud being pumped down the drill rods and returned up the annulus, carrying the drill cuttings. Only major changes in stratification can be determined from the cuttings, together with some information from the rate of penetration. Where drilling mud is used this can mask the cuttings and reliable identification is only possible from separate sampling such as SPTs.

Continuous Core Drilling

A continuous core sample can be obtained using a diamond tipped core barrel, usually with a 50 mm internal diameter. Provided full core recovery is achieved (which is not always possible in weak rocks and granular soils), this technique provides a very reliable method of investigation.

Standard Penetration Tests

Standard penetration tests (SPT) are used as a means of estimating the density or strength of soils and also of obtaining a relatively undisturbed sample. The test procedure is described in Australian Standard 1289, Methods of Testing Soils for Engineering Purposes - Test 6.3.1.

The test is carried out in a borehole by driving a 50 mm diameter split sample tube under the impact of a 63 kg hammer with a free fall of 760 mm. It is normal for the tube to be driven in three successive 150 mm increments and the 'N' value is taken as the number of blows for the last 300 mm. In dense sands, very hard clays or weak rock, the full 450 mm penetration may not be practicable and the test is discontinued.

The test results are reported in the following form.

- In the case where full penetration is obtained with successive blow counts for each 150 mm of, say, 4, 6 and 7 as:

  4,6,7
  N=13

- In the case where the test is discontinued before the full penetration depth, say after 15 blows for the first 150 mm and 30 blows for the next 40 mm as:

  15, 30/40 mm

The results of the SPT tests can be related empirically to the engineering properties of the soils.

Dynamic Cone Penetrometer Tests / Perth Sand Penetrometer Tests

Dynamic penetrometer tests (DCP or PSP) are carried out by driving a steel rod into the ground using a standard weight of hammer falling a specified distance. As the rod penetrates the soil the number of blows required to penetrate each successive 150 mm depth are recorded. Normally there is a depth limitation of 1.2 m, but this may be extended in certain conditions by the use of extension rods. Two types of penetrometer are commonly used.

- Perth sand penetrometer - a 16 mm diameter flat ended rod is driven using a 9 kg hammer dropping 600 mm (AS 1289, Test 6.3.3). This test was developed for testing the density of sands and is mainly used in granular soils and filling.
- Cone penetrometer - a 16 mm diameter rod with a 20 mm diameter cone end is driven using a 9 kg hammer dropping 510 mm (AS 1289, Test 6.3.2). This test was developed initially for pavement subgrade investigations, and correlations of the test results with California Bearing Ratio have been published by various road authorities.

Soil Descriptions

Douglas Partners

Description and Classification Methods

The methods of description and classification of soils and rocks used in this report are based on Australian Standard AS 1726-1993, Geotechnical Site Investigations Code. In general, the descriptions include strength or density, colour, structure, soil or rock type and inclusions.

Soil Types

Soil types are described according to the predominant particle size, qualified by the grading of other particles present:

Type	Particle size (mm)
Boulder	>200
Cobble	63 - 200
Gravel	2.36 - 63
Sand	0.075 - 2.36
Silt	0.002 - 0.075
Clay	<0.002

The sand and gravel sizes can be further subdivided as follows:

Type	Particle size (mm)
Coarse gravel	20 - 63
Medium gravel	6 - 20
Fine gravel	2.36 - 6
Coarse sand	0.6 - 2.36
Medium sand	0.2 - 0.6
Fine sand	0.075 - 0.2

The proportions of secondary constituents of soils are described as:

Term	Proportion	Example
And	Specify	Clay (60%) and Sand (40%)
Adjective	20 - 35%	Sandy Clay
Slightly	12 - 20%	Slightly Sandy Clay
With some	5 - 12%	Clay with some sand
With a trace of	0 - 5%	Clay with a trace of sand

Definitions of grading terms used are:

- Well graded - a good representation of all particle sizes
- Poorly graded - an excess or deficiency of particular sizes within the specified range
- Uniformly graded - an excess of a particular particle size
- Gap graded - a deficiency of a particular particle size with the range

Cohesive Soils

Cohesive soils, such as clays, are classified on the basis of undrained shear strength. The strength may be measured by laboratory testing, or estimated by field tests or engineering examination. The strength terms are defined as follows:

Description	Abbreviation	Undrained shear strength (kPa)
Very soft	vs	<12
Soft	s	12 - 25
Firm	f	25 - 50
Stiff	st	50 - 100
Very stiff	vst	100 - 200
Hard	h	>200

Cohesionless Soils

Cohesionless soils, such as clean sands, are classified on the basis of relative density, generally from the results of standard penetration tests (SPT), cone penetration tests (CPT) or dynamic penetrometers (PSP). The relative density terms are given below:

Relative Density	Abbreviation	SPT N value	CPT qc value (MPa)
Very loose	vl	<4	<2
Loose	l	4 - 10	2 -5
Medium dense	md	10 - 30	5 - 15
Dense	d	30 - 50	15 - 25
Very dense	vd	>50	>25

Soil Descriptions

Soil Origin

It is often difficult to accurately determine the origin of a soil. Soils can generally be classified as:

- Residual soil - derived from in-situ weathering of the underlying rock;
- Transported soils - formed somewhere else and transported by nature to the site; or
- Filling - moved by man.

Transported soils may be further subdivided into:

- Alluvium - river deposits
- Lacustrine - lake deposits
- Aeolian - wind deposits
- Littoral - beach deposits
- Estuarine - tidal river deposits
- Talus - scree or coarse colluvium
- Slopewash or Colluvium - transported downslope by gravity assisted by water. Often includes angular rock fragments and boulders.

Symbols & Abbreviations

Douglas Partners

Introduction

These notes summarise abbreviations commonly used on borehole logs and test pit reports.

Drilling or Excavation Methods

C	Core drilling
R	Rotary drilling
SFA	Spiral flight augers
NMLC	Diamond core - 52 mm dia
NQ	Diamond core - 47 mm dia
HQ	Diamond core - 63 mm dia
PQ	Diamond core - 81 mm dia

▷	Water seep
▽	Water level

Sampling and Testing

A	Auger sample
B	Bulk sample
D	Disturbed sample
E	Environmental sample
U_{50}	Undisturbed tube sample (50mm)
W	Water sample
pp	Pocket penetrometer (kPa)
PID	Photo ionisation detector
PL	Point load strength Is(50) MPa
S	Standard Penetration Test
V	Shear vane (kPa)

Description of Defects in Rock

The abbreviated descriptions of the defects should be in the following order: Depth, Type, Orientation, Coating, Shape, Roughness and Other. Drilling and handling breaks are not usually included on the logs.

Defect Type

B	Bedding plane
Cs	Clay seam
Cv	Cleavage
Cz	Crushed zone
Ds	Decomposed seam
F	Fault
J	Joint
Lam	Lamination
Pt	Parting
Sz	Sheared Zone
V	Vein

Orientation

The inclination of defects is always measured from the perpendicular to the core axis.

h	horizontal
v	vertical
sh	sub-horizontal
sv	sub-vertical

Coating or Infilling Term

cln	clean
co	coating
he	healed
inf	infilled
stn	stained
ti	tight
vn	veneer

Coating Descriptor

ca	calcite
cbs	carbonaceous
cly	clay
fe	iron oxide
mn	manganese
slt	silty

Shape

cu	curved
ir	irregular
pl	planar
st	stepped
un	undulating

Roughness

po	polished
ro	rough
sl	slickensided
sm	smooth
vr	very rough

Other

fg	fragmented
bnd	band
qtz	quartz

CERTIFICATE OF ANALYSIS 219713

Client Details

Client	Douglas Partners Pty Ltd (Port Macquarie)
Attention	Joel Cowan
Address	PO Box 5463, Port Macquarie, NSW, 2444

Sample Details

Your Reference	**31872.02, Harrington**
Number of Samples	4 Soil, 2 Material
Date samples received	17/06/2019
Date completed instructions received	17/06/2019

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	24/06/2019
Date of Issue	24/06/2019

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Method ID	Methodology Summary
ASB-001	Asbestos ID - Qualitative identification of asbestos in bulk samples using Polarised Light Microscopy and Dispersion Staining Techniques including Synthetic Mineral Fibre and Organic Fibre as per Australian Standard 4964-2004.
Inorg-008	Moisture content determined by heating at 105+/-5 °C for a minimum of 12 hours.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis. Note, the Total +ve TRH PQL is reflective of the lowest individual PQL and is therefore "Total +ve TRH" is simply a sum of the positive individual TRH fractions (>C10-C40).
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's. Note, the Total +ve reported DDD+DDE+DDT PQL is reflective of the lowest individual PQL and is therefore simply a sum of the positive individually report DDD+DDE+DDT.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD. Note, the Total +ve PCBs PQL is reflective of the lowest individual PQL and is therefore" Total +ve PCBs" is simply a sum of the positive individual PCBs.
Org-008	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.

Method ID	Methodology Summary
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013. For soil results:- 1. 'EQ PQL'values are assuming all contributing PAHs reported as <PQL are actually at the PQL. This is the most conservative approach and can give false positive TEQs given that PAHs that contribute to the TEQ calculation may not be present. 2. 'EQ zero'values are assuming all contributing PAHs reported as <PQL are zero. This is the least conservative approach and is more susceptible to false negative TEQs when PAHs that contribute to the TEQ calculation are present but below PQL. 3. 'EQ half PQL'values are assuming all contributing PAHs reported as <PQL are half the stipulated PQL. Hence a mid-point between the most and least conservative approaches above. Note, the Total +ve PAHs PQL is reflective of the lowest individual PQL and is therefore "Total +ve PAHs" is simply a sum of the positive individual PAHs.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note, the Total +ve Xylene PQL is reflective of the lowest individual PQL and is therefore "Total +ve Xylenes" is simply a sum of the positive individual Xylenes.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Report Comments

Asbestos: Excessive sample volumes were provided for asbestos analysis.
A portion of the supplied samples were sub-sampled according to Envirolab procedures.
We cannot guarantee that these sub-samples are indicative of the entire sample.
Envirolab recommends supplying 40-50g (50mL) of sample in its own container as per AS4964-2004.
Note: Samples requested for asbestos testing were sub-sampled from bags provided by the client.

Quality Assurance / Quality Control Report
Proposed Harrington Waters Lifestyle Village
26, 48 and 56 Manor Street, Harrington

Quality Assurance (QA) was maintained by:

- Compliance with a Project Quality Plan written for the objectives of the study;
- Using qualified and experienced personnel to undertake the field supervision and sampling;
- Following the Douglas Partners Pty Ltd (DP) operating procedures for sampling, field testing and decontamination as presented in Table D1; and
- Using National Association of Testing Authorities, Australia (NATA) registered laboratories for sample testing that generally utilise standard laboratory methods of the US EPA, the APHA and NSW EPA.

Table D1: Field Procedures

Abbreviation	Procedure Name
FPM LOG	Logging
FPM DECONT	Decontamination of Personnel and Equipment
FPM ENVID	Sample Identification, Handling, Transport and Storage of Contamination Samples
FPM PIDETC	Operation of Field Analysers
FPM ENVSAMP	Sampling of Contaminated Soils

Notes to Table D1:
From DP Field Procedures Manual

Quality Control (QC) of the laboratory programme was achieved by the following means:

- Method blanks - the laboratory ran reagent blanks to confirm the equipment and standards used were uncontaminated;
- Laboratory replicates – the laboratory split samples internally and conducted tests on separate extracts; and
- Laboratory spikes - samples were spiked by the laboratory with a known concentration of contaminants and subsequently tested for percent recovery.

Discussion

B. Method Blanks

All method blanks returned results lower than the laboratory detection limit, therefore are acceptable.

B. Laboratory Replicates

Duplicate sample analysis was not conducted by the laboratory on the samples analysed for this project. The laboratory does, however, analyse replicate samples in batches of 20 samples at a frequency to meet or exceed NEPM requirements. The duplicate sample relative percentage differences (RPDs) for the batch were within laboratory acceptance criteria.

C. Laboratory Spikes

Recoveries in the order of 70% to 130% are generally considered to be acceptable for inorganic material and 60% to 140% for organic material. The average percent recovery for individual contaminants ranged from 86% to 124%, which is within the quality control objectives. The results should however be qualified and may slightly under-estimate or over-estimate contaminant concentrations in certain samples (i.e. biased low or high respectively).

Conclusions

It is noted that the samples were sent on 13 June 2019 and where received by the laboratory on 17 June 2019 with the temperature of the samples recorded at 14° on arrival. PID results on the soils during sampling indicated the absence gross volatile hydrocarbon impacts (ie PID <1 ppm), which was consistent with the results of laboratory testing received.

In summary, the accuracy and precision of the soil testing procedures, as inferred by the laboratory QA / QC data is considered to be of sufficient standard to allow the data reported to be used in interpret site contamination conditions.

Additional Info

Sample storage - Waters are routinely disposed of approximately 1 month and soils approximately 2 months from receipt.
Requests for longer term sample storage must be received in writing.
Please contact the laboratory immediately if observed settled sediment present in water samples is to be included in the extraction and/or analysis (exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS analysis where solids are included by default.
TAT for Micro is dependent on incubation. This varies from 3 to 6 days.

New South Wales

No. 1969/1962

Vol. 11153 Fol. 97
Registered 16-10-1969
Registrar General.

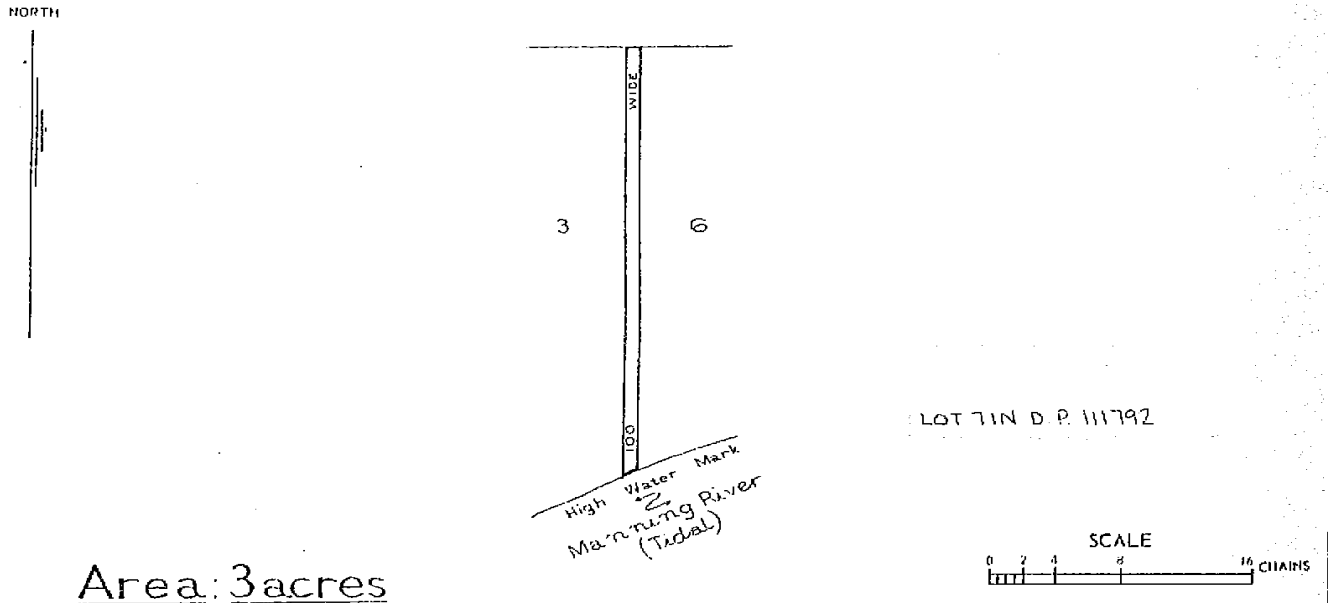
GRANT UPON PURCHASE OF UNNECESSARY ROAD

(Under the Public Roads Act, 1902)

ELIZABETH the SECOND, by the Grace of God of the United Kingdom, Australia and her other Realms and Territories Queen, Head of the Commonwealth, Defender of the Faith:—

To All to whom these Presents shall come, Greeting:—

Whereas WILLIAM HERBERT SHEATHER of Harrington Road Harrington in Our State of New South Wales (hereinafter called the GRANTEE) being the owner of land adjoining the land hereinafter described and intended to be hereby granted (formerly a road which was duly closed in accordance with the provisions of the Public Roads Act, 1902) agreed to have such land granted to him upon payment of the sum of seventy five dollars being the value thereof agreed upon between Our Minister for Lands and the GRANTEE AND WHEREAS the said sum has been duly paid and all things required by law to be done to entitle the GRANTEE to a Grant of the fee simple of the said land Subject to the Reservations and Exceptions hereinafter contained have been done and performed NOW THESE PRESENTS WITNESS That in consideration of the premises WE DO HEREBY GRANT unto the GRANTEE Subject to the Reservations and Exceptions hereinafter contained ALL THAT parcel of land containing by admeasurement three acres be the same more or less situated in the County of Macquarie Parish of Harrington Being the closed road separating portion 3 from portion 6



Area: 3 acres

As per Plan hereon TO HOLD unto the GRANTEE in fee simple PROVIDED NEVERTHELESS AND WE DO HEREBY RESERVE AND EXCEPT unto Us Our Heirs and Successors all minerals which the said Land contains with full power and authority for Us Our Heirs and Successors and such person or persons as shall from time to time be authorised by Us or Them to enter upon the said Land and to search for mine dig and remove the said minerals AND ALSO all such parts and so much of the said Land as may hereafter be required for public ways in over and through the same to be set out by Our Governor for the time being of Our said State or some person by him authorised in that respect with full power for Us Our Heirs and Successors and for Our Governor as aforesaid by such person or persons as shall be by Us Them or him authorised in that behalf to make and conduct all such public ways And the right of full and free ingress egress and regress into out of and upon the said Land for the several purposes aforesaid or any of them IN TESTIMONY WHEREOF We have caused this Our Grant to be Sealed with the Seal of Our said State

Witness Our Governor of Our State of New South Wales and its Dependencies in the Commonwealth of Australia, at Sydney in Our said State, this first day of October in the eighteenth year of Our Reign and in the year of Our Lord one Thousand nine hundred and sixty nine

TYPICAL SOIL & WATER MANAGEMENT PLAN

TATTERSALL LANDER Pty Ltd
DEVELOPMENT CONSULTANTS

SCALE : 0 10 20m
1:2000 for A3 sized plot

SHEET No. :19 | FILE : 21800156 | SHEET SIZE
JOB No. : 217154 | DATE : Plotted 09:24 28/06/19 | A3

COMPUTER FILE : S:\projects\Harrington\dwg\217154_Harrington DA Plans.dwg

Xref: Base2 XREF [Base2 XREF.dwg] Xref: CutFill XREF [CutFill XREF.dwg] Xref: Harrington Waters Lifestyle Master Plan [Harrington Waters Lifestyle Master Plan.dwg] Xref: 217154 PRELIM DP [217154 PRELIM DP.dwg] Xref: BaseRev C XREF [BaseRev C XREF.dwg]

SOIL & WATER MANAGEMENT NOTES

1. This plan is to be read in conjunction with other engineering plans and any written instructions that may be issued.

2. The contractor shall implement all soil erosion and sediment control measures prior to disturbance of the related catchment area and to the satisfaction of the Superintendent.

3. All positions shown are indicative only and are best determined on site in conjunction with the superintendent. Variations will be permitted to best suit the circumstances.

4. Cleared vegetation must be disposed of by :-
i) chipping or mulching for future landscaping and usage, or
ii) transport to an approved landfill facility.

5. Temporary crossbanks (bunds constructed with earth, straw bales or sandbags), shall be constructed during roadworks to limit slope length, where possible, to 80 metres. These shall be constructed immediately prior to forecast rain and during temporary closure of the site, including weekends.

6. Temporary rehabilitation should be undertaken on disturbed areas where works have stopped and soils are expected to remain exposed for two months.

7. Sediment barriers (e.g. sandbags or straw bales) should be located upstream of stormwater inlet pits prior to the road surface being paved and lands upslope being rehabilitated.

8. At the conclusion of each day sand bags are to be placed at the end of completed sections of road pavement to prevent scouring.

9. The contractor will inspect all erosion and pollution control works at least weekly and following every rainfall event greater than 5mm, providing particular attention to the following matters :
   (a) Ensure drains operate effectively and initiate repair as required.
   (b) Remove spilled sand (or other materials) from hazard areas, including lands closer than 5 metres from likely areas of concentrated or high velocity flows such as waterways and paved areas.
   (c) Ensure rehabilitated lands have effectively reduced the erosion hazard and initiate upgrading or repair as appropriate.
   (d) Construct additional erosion and/or sediment control works as might become necessary to ensure the desired protection is given to downslope lands and waterways, i.e.,make ongoing changes to the plan.
   (e) Maintain erosion and sediment control measures in a functioning condition until all earthwork activities are completed and the site is rehabilitated.
   (f) Remove temporary soil conservation structures as a last activity in the rehabilitation program.

10. Utilise a single access only to the stock pile sites.

11. Drop inlets which do not outlet to silt traps shall be blocked until all works are completed.

12. Limit disturbed areas on site as much as possible at any one time, and stabilise competed areas as soon as practicable. Lands where works are not to continue for more than 20 working days must be rehabilitated. Such rehabilitation shall involve the spraying of a straw-bitumen mulch to the disturbed lands or equivalent.

13. Access areas limited to a maximum width of 10 (preferably 5) metres.

14. Conformity with this plan shall in no way reduce the responsibility of the Contractor to protect against water damage during the course of the contract.

15. Topsoil and spoil shall be stockpiled in non-hazard areas and protected from surface run-off by diversion drains or similar. Stockpiles shall be surrounded on downstream sides by silt fencing. Stockpiles shall be suitably compacted to inhibit erosion. Where the stockpiling period exceeds four (4) weeks, the stockpile shall be seeded to encourage vegetation growth.

16. Topsoil shall be respread and stabilised as soon as possible. Disturbed areas shall be left with a scarified surface to encourage water infiltration and assist keying in topsoil.

17. The contractor shall provide a turf strip behind all kerb and gutter at completion of footpath formation.

18. The contractor shall maintain grass cover until all works have been completed including the maintenance period, by frequent watering and mowing where required.

19. All drainage works shall be constructed and stabilised as quickly as possible to minimise risk of erosion.

20. Vehicular traffic shall be controlled during construction confining access where possible to proposed or existing road alignments plus 3 metres. Areas to be left undisturbed shall be marked off.

21. Site access shall be restricted to a nominated point. The construction of a shake-down area will be required at the entry to the site.

22. Facilities and/or equipment must be provided for the application of water to disturbed areas to minimise the generation of airborne dust from any area disturbed by construction activities.

23. Material removed from sediment control structures must be disposed of in a way that does not pollute waters or bushland.

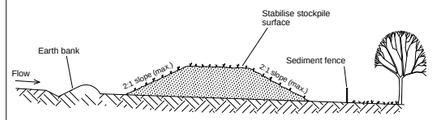
24. Waste disposal containers must be provided on site for the collection and disposal of all industrial and domestic type wastes generated on site.

25. Concrete wastes or washings from any concrete mixture or deliveries must not be deposited in any location where they can flow or be washed into waters.

26. Runoff from vehicle, construction plant or mobile plant maintenance and cleaning areas must be contained, collected and disposed of in a manner to prevent entry into any waters, including sediment retention ponds.

27. Fuelling of vehicles and construction plant must be carried out with an operator or driver present, and in a way that prevents any spillage occurring.

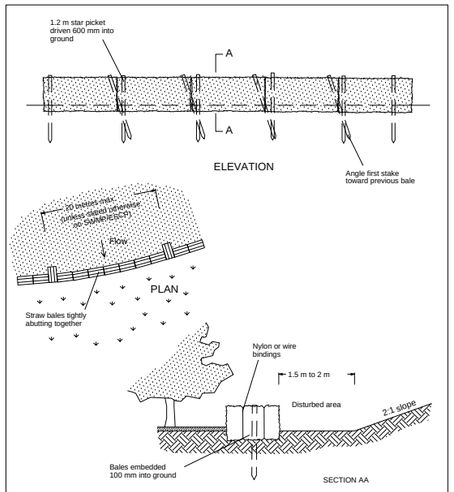
28. Prior to the controlled discharge (e.g. de-watering activities from excavations and sediment basins) of any water (groundwater or sediment laden water) from the site during construction, the following water quality objectives shall be achieved:
   * not exceed Total Suspended Solids of 50mg/L
   * not exceed Turbidity of 50 NTU
   * range within pH value of 6 to 8
   * be < 80% and > 20% saturation dissolved oxygen
   * have no odour or visible petro-chemical sheen
   * have no visible litter or waste matter
   * not contain any other contaminant, chemical or biological condition which causes any measurable adverse effect



Construction Notes

1. Place stockpiles more than 2m (preferably 5m) from existing vegetation, concentrated water flow, roads and hazard areas.
2. Construct on the contour as low, flat, elongated mounds.
3. Where there is sufficient area, topsoil stockpiles shall be less than 2m in height.
4. Where they are to be in place for more than 10 days, stabilise following the approved ESCP or SWMP to reduce the C-factor to less than 0.10.
5. Construct earth banks (Std Drawing 5-5) on the upslope side to divert water around stockpiles & sediment fences (Std Drawing 6-8) 1-2m downslope.

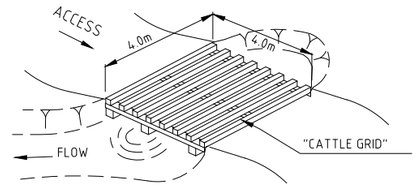
STOCKPILES SD 4-1



Construction Notes

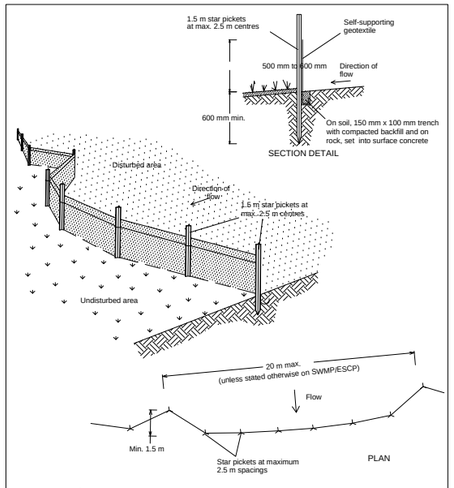
1. Construct the straw bale filter as close as possible to being parallel to the contours of the site.
2. Place bales lengthwise in a row with ends tightly abutting. Use straw to fill any gaps between bales. Straws are to be placed parallel to ground.
3. Ensure that the maximum height of the filter is one bale.
4. Embed each bale in the ground 75 mm to 100 mm and anchor with two 1.2 metre star pickets or stakes. Angle the first star picket or stake in each bale towards the previously laid bale. Drive them 600 mm into the ground and, if possible, flush with the top of the bales. Where star pickets are used and they protrude above the bales, ensure they are fitted with safety caps.
5. Where a straw bale filter is constructed downslope from a disturbed batter, ensure the bales are placed 1 to 2 metres downslope from the toe.
6. Establish a maintenance program that ensures the integrity of the bales is retained - they could require replacement each two to four months.

STRAW BALE FILTER SD 6-7



TEMPORARY CONSTRUCTION EXIT SHAKE-DOWN FACILITY DETAIL (CATTLE GRID)

NOT TO SCALE



Construction Notes

1. Construct sediment fences as close as possible to being parallel to the contours of the site, but with small returns as shown in the drawing to limit the catchment area of any one section. The catchment area should be small enough to limit flow if concentrated at one point to 50 l/s in the design storm, usually the 10yr event.
2. Cut a 150-mm deep trench along the upslope line of the fence for the bottom of the fabric to be entrenched.
3. Drive 1.5m long star pickets into ground at 2.5m intervals (max) at the downslope edge of the trench. Ensure any star pickets are fitted with safety caps.
4. Fix self-supporting geotextile to the upslope side of the posts ensuring it goes to the base of the trench. Fix the geotextile with wire ties or as recommended by the manufacturer. Only use geotextile specifically produced for sediment fencing. The use of shade cloth for this purpose is not satisfactory.
5. Join sections of fabric at a support post with a 150mm overlap.
6. Backfill the trench over the base of the fabric and compact it thoroughly over the geotextile.

SEDIMENT FENCE SD 6-8
