

**217 Beach Rd, Denhams Beach  
Cliff Stabilisation**

The retaining walls needed to be installed as part of the environmental protection works to secure and stabilise the bank and batter.

The bank and batter will then be able to withstand loadings from the proposed dual occupancy buildings,

As an additional safety measure, the buildings at the top of the embankment will be designed to cantilever off the western excavation and support the entire structure in the remote chance the stabilised batter collapses,
