

15 June 2022

Laura Van Putten
A/Senior Land Use Assessment Coordinator
Transport for NSW

Dear Laura,

RESPONSE TO SUBMISSION:

STAGED RESIDENTIAL SUBDIVISION OF ONE EXISTING ALLOTMENT TO CREATE 123 TORRENS TITLE LOTS FOR FUTURE RESIDENTIAL DEVELOPMENT AND 22 RESIDUE LOTS AND ASSOCIATED WORKS INCLUDING BULK EARTHWORKS, CIVIL WORKS, CONSTRUCTION OF TEMPORARY ON-SITE DETENTION BASINS, STORMWATER DRAINAGE AND NEW ROADS AT LOT 184 GURNER AVENUE, AUSTRAL

Introduction

SCT Consulting prepared the *Traffic and Access Study for Austral Structure Plan DA* (submitted on 27 October 2021) to support the development application (DA) for a residential subdivision that could yield around 422 dwellings at 35 Gurner Avenue, Austral. The site is under Lot 184 DP 1237400, located in the Liverpool City Council Local Government Area (LGA).

This technical memorandum is prepared to respond to comment No. 4 provided by TfNSW issued on 27 May 2022 for the abovementioned application:

Comment No. 4. The traffic report prepared by SCT Consulting dated 27 October 2021 provides the following scenarios:

- a) Northbound traffic gives way to southbound traffic (AM)*
- b) Southbound traffic gives way to northbound traffic (PM)*
- c) Northbound traffic gives way to southbound traffic (AM)*
- d) Southbound traffic gives way to northbound traffic (PM).*

It is unclear as to which intersections have been assessed. TfNSW requires SIDRA modelling to show predicted growth with general practice usually showing modelling for the day of opening plus 10 years post-development. TfNSW requests the intersection of Edmondson Avenue and Fifteenth Avenue to be assessed in the SIDRA modelling. SIDRA outputs shall be submitted for further review.

The traffic modelling in the previous study only covered a mid-block assessment to evaluate vehicle queueing on Edmondson Avenue (between Gurner Avenue and Swamphen Street) due to the temporary half-width road configuration.

Hence, supplementary traffic modelling has been carried out in this study to evaluate the intersection performance for Edmondson Avenue and Fifteenth Avenue as requested by TfNSW.

Traffic demand

As part of this response to submission, SIDRA modelling was carried out for the intersection of Edmondson Avenue and Fifteenth Avenue for the AM peak hour in 2026 (assumed year of opening) and 2036 (assumed year of opening plus 10 years post-development).

In order to consider the cumulative impacts of the surrounding development including the network background growth, the progressive development of Austral-North Leppington Precinct and the proposed expansion of the Al-Faisal College (being assessed as part of an SSDA and not approved), traffic forecasts were extracted from the *Transport & Accessibility Assessment for Al-Faisal College* by Traffix (2020), which was undertaken to support the expansion of the existing Al Faisal Primary School and the development of a new Al Faisal Secondary School. The two school sites are located in the vicinity of the residential subdivision and would accommodate about 5,500 students when the development is fully delivered.

We have assumed that the traffic forecasts extracted from the Traffix (2020) report included traffic increases as a result of the network background growth, the progressive development of Austral and Leppington North Precinct and the proposed expansion of the Al-Faisal College.

For comparison purposes, only AM peak hour will be assessed in this study since PM peak hour was not included in Traffix's traffic study. AM peak is typically the worst peak as traffic is more concentrated with commuters typically drive to work in a narrower time period in the morning than the PM peak.

The traffic volumes extracted from the Traffix's traffic study in 2026 and 2036 for the AM peak hour are replicated and shown in **Table 1**.

As calculated in **Section 4.5** of SCT Consulting's *Traffic and Access Study for Austral Structure Plan DA*, it is estimated that the residential subdivision would generate around 375 vehicles in both directions in the AM peak hours including around 215 vehicles generated by the western precinct and 160 vehicles generated by the eastern precinct, respectively (**Table 2**).

Table 2 Trip generation for the AM peak hour

Land use	Trip rates	Yield		Trip generation	
		West	East	West	East
Low-density residential	0.95 veh per dwelling	+226 dwellings	+111 dwellings	+215 vehicle trips	+105 vehicle trips
Medium-density residential	0.65 veh per dwelling	-	+85 dwellings	-	+55 vehicle trips
Total		+422 dwellings		+215 vehicle trips	+160 vehicle trips

Given the nature of the strategic road and local road network, it is assumed that the traffic distribution of the subdivision would be:

- 20 per cent of the traffic generated by the western precinct would travel along Gurner Avenue westbound. Hence, this part of the traffic would not use the intersection of Edmondson Avenue and Fifteenth Avenue.
- The remaining 80 per cent of the traffic for the western precinct would be distributed in three directions via the intersection of Edmondson Avenue and Fifteenth Avenue, i.e. 25 per cent eastbound, 30 per cent southbound and 25 per cent westbound.
- 25 per cent of the traffic generated by the eastern precinct would travel westbound along Fifteenth Avenue.
- The percentages remain consistent in the inversed directions.

The proposed yield of the subdivision is consistent with the Austral and Leppington Precinct ILP and the Liverpool Growth Centre Precincts DCP. Hence, it is assumed that the trip generation of the subdivision would be included in the traffic increases as a result of planned development of Austral and Leppington North Precinct.

However, for the purpose of this assessment, the additional trip generation as a result of the subject residential subdivision has been included as a worst-case scenario assessment.

Modelling approach

SCT Consulting proposed the below modelling approach:

- **Step 1:** Develop an intersection model by extracting information from Traffix's traffic report including geometry layout, peak hour traffic volumes and signal timing.
- **Step 2:** Calibrate the models to ensure high consistency of the results between the duplicated model and the original model (by Traffix).
- **Step 3:** Add development traffic as calculated in **Table 2** and rerun the model to understand any impact on the intersection performance as a result of the proposed subdivision.

It is noted that the intersection of Edmondson and Avenue Fifteenth Avenue is expected to be upgraded to a fully signalised intersection to accommodate the traffic increase in the future. The proposed geometry is based on the layouts specified in the *Austral and Leppington North Precinct Plan – Post Exhibition Planning Report (Addendum) 2012 (Figure 1)*.

Figure 1 Proposed intersection layout

Intersection performance

Operational performance is typically measured through an assessment of the throughput of vehicles across a traffic network, with the average delay per vehicle used to assess the performance of an intersection. This is consistent with Roads and Maritime Service best practice and is the industry standard for the assessment of intersection performance. The average delay per vehicle measure is linked to a Level of Service (LoS) index which characterises the intersection's operational performance. **Table 3** provides a summary of the LoS performance bands.

Table 3 Level of Service Index

Level of Service	Average Delay per Vehicles (sec/h)	Traffic Signals / Roundabout	Give Way / Stop Signs
A	Less than 14.5	Good operation	Good operation
B	14.5 to 28.4	Good with acceptable delays and spare capacity	Acceptable delays and spare capacity
C	28.5 to 42.4	Satisfactory	Satisfactory, but incident study required
D	42.5 to 56.4	Operating near capacity	Near capacity and incident study required
E	56.5 to 70.4	At capacity, at signals incidents will cause excessive delays. Roundabouts require other control method.	At capacity, requires other control method
F	70.5 or greater		

Source: Guide to Traffic Generating Developments; (then) Roads and Maritime Services; 2002

Traffic modelling was undertaken using SIDRA 9.0 and a summary of the intersection performance for the three scenarios is provided in **Table 4**. A more detailed SIDRA output is shown in **Appendix A**.

Table 4 Intersection performance

Performance metric	Traffix's original model		Duplicated model		Updated model with subdivision	
	2026	2036	2026	2036	2026	2036
Total throughput	3,863	5,744	3,863	5,744	4,073	5,954
Traffic increase due to the subdivision	-	-	-	-	210 (+5.4%)	210 (+3.7%)
DoS	0.60	1.04	0.74	1.06	0.74	1.06
Delay	37.1s	82.6s	39.6s	81.2s	40.4s	82.4s
LoS	C	F	C	F	C	F
95 th Percentile queue length*	134.7m (W)	483.7m (W)	149.6m (W)	519.7m (W)	150.8m (W)	525.6m (W)

*Letters in the brackets indicate the approach with the longest forecast queue.

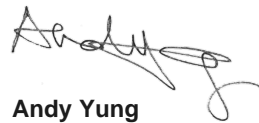

It is acknowledged that there is a minor difference between Traffix's original model and the duplicated model such that the duplicated model is fit for testing updated traffic demand. The SIDRA modelling with the addition of the subdivision traffic confirms that:

- There is a minimal increase in the throughput at the intersection (up to five percent increase in the AM peak hour in 2026 and 2036 associated with the residential subdivision).
- The intersection remains to operate at the same Level of Service after adding the development traffic. There is no change in Degree of Saturation and there is limited increase in intersection delays.
- Longer queue lengths occur for the western approach. However, the increment is minor and insignificant.
- By 2036, the intersection records a LoS F. As stated in Traffix's traffic study, it is noted that the intersection had already failed without the school development. Further infrastructure upgrade is necessary to accommodate the background growth, which is to be considered by TfNSW.
- Since the school traffic represents about 13 per cent traffic increase in 2036 (+772 vehicles) at this intersection, Hence, the traffic generated by the residential subdivision (+210 vehicles) has much less impact on the intersection performance.

Conclusion

To respond to the comment from TfNSW, this study confirms that the proposed residential subdivision has marginal impact on the intersection of Edmondson and Avenue Fifteenth Avenue.

Yours sincerely

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

* Critical Movement (Signal Timing)

Pedestrians												

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)

Pedestrian movement LOS values are based on average delay per pedestrian movement.

Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.
