Executive Summary

Statewide Planning Pty Ltd (Statewide) commissioned Sullivan Environmental Sciences (Sullivan-ES) to revise and update the Phase 2 Contamination Assessment (the Phase 2) for a cluster of properties located on Loftus Crescent, Subway Lane and Parramatta Road in Homebush NSW. Since previous sampling was conducted in 2016, the subject site has been expanded to include a number of properties on the adjoining Knight Street; as such, additional investigations were needed to examine contamination risks on the additional lots.

The site is the subject of a Development Application (DA) to develop the site for mixed high-rise residential and commercial retail use. The proposed development comprises three residential flat buildings off Loftus Crescent, Parramatta Road and Knight Street with basement car parking. The proposed development also includes an upgrade and creation of a link road (called Loftus Lane) between Knight Street and Subway Lane, as well as dedicated landscaped garden areas across large parts of the site.

The objective of the Phase 2 was to characterise the soil and groundwater at the site and assess potential health risk to future site users. The scope of work included: reviewing background information, drilling and sampling of soil at 19 borehole locations, installing and sampling 4 temporary groundwater monitoring wells, chemical analysis for a suite of contaminants at a NATA accredited laboratory, and preparation of this Phase 2 report in consideration of the Guidelines for Consultants Reporting on Contaminated Sites, 2011, the State Environmental Planning Policy 55 (the SEPP55), and Schedule B2 of the National Environment Protection (Assessment of Site Contamination) Measure 2013.

Sullivan-ES make the following conclusions based on the findings of this revised Phase 2, subject to the report limitations presented in Section 9:

Site History and Conditions

- Historical aerial photos show that the site has been used for residential purposes on Loftus Crescent since circa 1930, while the Parramatta Road retail buildings have been present since the same time. The motor mechanics workshop was established at 2 Subway Lane circa 1960 while large warehouse-style buildings were located on Knight Street prior to 1943 after which residential flat buildings were constructed.
- Overall there appears to be little historical activity over the site in general that would pose significant contamination issues other than the motor mechanics/panel beaters workshop and the warehouse buildings on Knight Street prior to 1943. It is not known if the motor mechanics/panel beaters workshop was ever used as a service station in the past.
- Based on the findings of a detailed site inspection and review of site activities since 2016, it was found to be very unlikely that activities conducted on site since the previous sampling in 2016 would invalidate those test results. As such, test results from 2016 were adopted for reporting in this Phase 2.

Soils and Contamination Sources

- The site soils generally comprise shallow layers of fill material underlain by natural clays, followed by competent shale bedrock at approximately 2.0-5.0 mbgl. No perched groundwater was encountered as groundwater resides in the natural deeper clay/shale strata.
- Black granular materials in the surface fill layers was observed at a number of sampling locations indicating charcoal or ashy gravel material.
- Metal lid covers located in the forecourt parking area of the motor mechanics workshop is evidence of underground tanks being present beneath this area. The tanks will need to be removed and

Executive Summary

surrounding soils validated. Soil and groundwater sampling results show no detection of contaminants proximal to the tanks.

- A small concrete pit is located within the former mechanics/panel beater workshop. Once the slab has been demolished the localised soils should be inspected for signs of contamination, and if so, additional sampling would be warranted to quantify contamination risk.
- Detectable concentrations of the contaminant BaP TEQ over the human health land use criteria at sampling location BH5, SB11 and SB18 is caused by charcoal/ash gravels warranting remediation to remove human health contamination risks and unacceptable aesthetic issues within landscaped areas of the future development.
- The calculated 95% Upper Confidence Limit (UCL) of the arithmetic mean concentration for BaP TEQ was 4.59mg/kg which exceeds the adopted human health criteria of 4mg/kg, as such all surface/near surface fill material impacted with charcoal/ash gravels within proposed landscaped areas of the development poses an unacceptable risk to human and ecological health warranting remediation.
- All soils to be retained onsite under the new roadway of Loftus Lane meet the adopted human health investigation criteria for such land use under a commercial/industrial setting.
- The exception to this is the fill material at sampling location BH7 which is impacted by PAHs and attributed to the charcoal/ash gravels. The impacts are expected to be localised in the immediate area around BH7. The impacted fill material in this area will be removed regardless to construct the new Loftus Lane roadway over BH7.
- The indicative waste classification for impacted fill at BH7 is Hazardous Waste, however this is a preliminary classification based on total concentrations only. At the time of bulk earthworks and prior to removal from the site, waste classifications should be verified with leachable concentration (TCLP) results in accordance with the NSW EPA Waste Classification Guidelines, 2014.
- Fill materials to be excavated for the new car park basements can be removed offsite under an indicative waste classification as either General Solid Waste or Hazardous Waste. However, as before, these waste classifications are preliminary and based on total concentrations only. At the time of bulk earthworks and prior to removal from the site, any waste classifications must be verified with leachable concentration (TCLP) results in accordance with the NSW EPA Waste Classification Guidelines, 2014.
- Natural soils and bedrock to be excavated for the new car park basements can be removed offsite as Virgin Excavated Natural Material (VENM) as defined in Schedule 1 of the Protection of the Environment Operations Act 1997.
- Residual natural soils and rock remaining after bulk earthworks contains no elevated concentrations of contaminants and poses no risk to human health and are therefore suitable to remain on the site.

Groundwater

- Detections of contaminants (predominately metals) in groundwater is attributed to endemic urban sources given that there are unlikely to be any related contamination sources of this nature on the site.
- Detections of hydrocarbons in the groundwater is attributed to the naturally occurring longer chain petrogenic sources in the shale bedrock. The concentrations are reported below the health screening levels.
- Low level detection of contaminants in groundwater are not considered a cause for concern that would warrant further assessment or precludes use of the site for its intended use.
- Groundwater well BH6 was positioned proximal to the laundromat (potential dry-cleaning operation) on the adjoining eastern boundary. Results from BH6 show no impacts from dry cleaning chemicals

Executive Summary

in the groundwater. However, the low-level detection of chloroform could be residual impacts from the use of bleaches by the laundromat offsite, although this assumption has not been verified.

Recommendations

- Prepare a Remedial Action Plan (RAP) to address the identified soil contamination within proposed landscaped areas and document protocols for waste classification of soil/fill to be removed offsite. The RAP should be prepared by a suitably competent consultant specialising in contaminated land management.
- Underground tanks located in the forecourt parking area of the motor mechanics workshop are to be removed in accordance with Australian Standard methods and the soils validated in accordance with the Protection of the Environment (Underground Petroleum Storage System) Regulations 2014. The tank decommissioning works should be included with the RAP.
- Once the slab of the motor mechanics workshop has been demolished, the localised soils around the concrete sump pit should be inspected for signs of contamination, and if so, additional sampling would be warranted to quantify contamination risks particular to this area. These details should be documented in the RAP.

This page intentionally left blank

Introduction

Statewide Planning Pty Ltd (Statewide) commissioned Sullivan Environmental Sciences (Sullivan-ES) to revise and update the Phase 2 Contamination Assessment (the Phase 2) for a cluster of properties located on Loftus Crescent, Subway Lane and Parramatta Road in Homebush NSW. Since previous sampling was conducted in 2016, the subject site has been expanded to include a number of properties on the adjoining Knight Street; as such, additional investigations were needed to examine contamination risks on the additional lots. The site locality is shown on Figure 1 and the site plan is shown on Figure 2 (**Appendix A**).

The site has been subject to approved demolition and clearing to make way for a new development, however a residential flat building currently remains at 11 Knight Street. The site previously contained low-density residential dwellings along Loftus Crescent, a motor mechanics/panel beaters workshop on Subway Lane, and commercial retail buildings along Parramatta Road with a rear access laneway off Knight Street.

The site is the subject of a Development Application (DA) to develop the site for mixed high-rise residential and commercial retail use. The proposed development has been altered since the previous sampling conducted in 2016 and now comprises three residential flat buildings off Loftus Crescent, Parramatta Road and Knight Street. The proposed development also includes an upgrade and creation of a link road (called Loftus Lane) between Knight Street and Subway Lane, as well as dedicated landscaped garden areas across large parts of the site.

It is understood that the development will require the majority of soil materials to be removed from beneath the site to a depth of approximately 6 metres below existing ground to accommodate basement car parking; however large areas of the site will retain soils either under Loftus Lane or dedicated landscape areas.

1.1 Objective

The overall objective of the Phase 2 was to assess the soils and groundwater for any contamination risks from historical and current land uses in consideration of the proposed land use; as well as document any changes to the site since previous sampling in 2016 that may cause a contamination risk.

1.2 Scope of Work

The scope of work was conducted in two parts, noting that the initial work was combined with a geotechnical investigation (D. Katauskas 2016).

2016 – Initial Sampling

- Reviewing and documenting background information such as aerial photographs, environmental information and published geological and soil maps.
- Preparing a health and safety plan and brief sampling work plan for all field-based work on the site.
- Mobilising to the site and conducting a detailed site inspection to document the current site conditions, the surrounding environments and perform an underground pipe survey to clear and confirm proposed borehole drilling and sampling locations.
- Coring of the concrete at proposed borehole locations to enable access of the soils for drilling.
- Drilling and sampling a total of eleven (11) boreholes across the site consisting of:
 - Drilling of six (6) soil bores with a mechanical drilling rig to a maximum depth of 9.0 metres below ground level (mbgl) and collection of soil samples at various depths.

1 Introduction

- Constructing temporary groundwater monitoring wells at four (4) drilled borehole locations and securing with a metal cover.
- Augering of five (5) soil bores with a hand auger to a maximum depth of 1.1 mbgl and collection of soil samples at various depths.
- Backfilling all soil bores with cuttings and demobilising from the site.
- Remobilising to the site after the groundwater wells had stabilised and collecting a sample of groundwater from each of the 4 monitoring wells.
- Performing laboratory analysis of collected samples of soil and groundwater including QA/QC samples.
- Preparing a Phase 2 Contamination Assessment report in consideration of the NSW EPA Guidelines for Consultants Reporting on Contaminated Sites, 1997 (the Reporting Guidelines), the State Environmental Planning Policy 55 (the SEPP55), and the National Environment Protection (Assessment of Site Contamination) Measure 2013 (the ASC NEPM 2013).

2018 – Additional Investigations

- Reviewing historical aerial photographs of the Knight Street properties.
- Updating the safety and sampling work plan for all field-based work on the site.
- Conducting a detailed site inspection to document current site conditions, surrounding environments and any environmental impediments to the development proposal.
- Surveying underground services using Dial-Before-You-Dig service plans to confirm proposed borehole drilling and sampling locations.
- Drilling and sampling a total of eight (8) boreholes using a hand auger in unsealed locations on the Knight Street properties to a maximum depth of 1.0 metres below ground level (mbgl) or to 0.5m into natural soil (whichever is first) and collection of soil samples at various depths.
- Backfill all soil bores with cuttings and demobilise from the site.
- Dispatch collected samples of soil for chemical analysis.
- Preparing a revised version of the Phase 2 Contamination Assessment report in consideration of the Reporting Guidelines, SEPP55, and the ASC NEPM 2013.

1.3 Regulatory Framework

The Phase 2 was conducted in consideration of the following regulatory framework and guideline documents:

- Contaminated Land Management Act 1997 (NSW) (CLM Act).
- State Environmental Planning Policy No.55 – Remediation of Land 1998 (SEPP55).
- National Environment Protection (Assessment of Site Contamination) Measure 2013 (ASC NEPM 2013).
- Guidelines for Consultants Reporting on Contaminated Sites, 2011 (OEH 2011).
- Sampling Design Guidelines, 1995 (NSW EPA 1995).
- Guidelines for the NSW Site Auditor Scheme (3rd Edition), 2017 (NSW EPA 2017).
- NSW EPA, Waste Classification Guidelines – Part 1: Classifying Waste, 2014 (NSW EPA 2014).

1.4 Certification and Competency of Consultant

All contamination assessment work was conducted by Sullivan-ES. Our Principal Scientist (Mr Adam Sullivan) has achieved tertiary qualifications in Soil Science and Environmental Law. He is a certified Site Contamination Specialist (CEnvP-SC) (Cert. # SC40944) under the Certified Environmental Practitioner Scheme (www.cenvp.org).

Site Information

2.1 Site Identification

The site layout is presented on Figure 2 (**Appendix A**). The following table presents all relevant site identification details.

Table 2-1 Site Identification

Item	Details	
Address	10-16 Loftus Cr 5, 9 & 11 Knight St 88-92a Parramatta Rd 2 Subway Ln. in Homebush NSW 2140	
Local Government	Strathfield Council	
Land zoning	B4 – Mixed Use SP2 – Infrastructure – Local Road (Loftus Lane)	
Property area	Approximately 5,000m ²	
Land Titles (Lot and DP)	<u>10-16 Loftus Cr:</u> Lot 101 DP 846306 Lot 2 DP 314354 Lot 1 DP 201286 Lot 2 DP 201286 Lot A DP 419854 Lot B DP 419854 Lot A DP 335908	<u>88-92a Parramatta Rd:</u> Lot 1 DP 201120 Lot 2 DP 201120 Lot 3 DP 201120 Lot A DP 419617
	<u>5, 9 & 11 Knight St:</u> Lot A DP 335091 Lot 1 DP 336700 SP 1702	<u>2 Subway Ln:</u> Lot 7 DP 18702 Lot B DP 403083

2.2 Site Features

A photographic record of site features in 2016 and 2018 is provided in **Appendix D**.

Loftus Crescent properties:

Previously (2016):

The Loftus Crescent area was relatively flat land sloping gently down to the west and contained single storey brick houses facing Loftus Crescent (**Photo 1** and **Photo 2**). Number 10 was a double storey brick duplex building.

Ground surfaces were mainly unsealed apart from building footprints, driveways and parking areas.

2 Site Information

A fibro cement clad shed was present in the rear yard of No. 15 (**Photo 4**) and broken fibro sheeting was observed nearby on the ground surface of the side access to No. 15 (**Photo 5**).

All buildings on Loftus Crescent and the rear yards to No. 11 and 12, No. 13 and 14, and No. 16 were inaccessible at the time of sampling.

Currently (2018):

All buildings on Loftus Crescent have been demolished (**Photo 10** and **Photo 11**). Some demolition materials and screened soil materials are stockpiled in the central portion of this area. Linx Constructions confirmed (pers. comm. Glenn Francis 17 July 2018) that the materials remaining onsite consist of waste from demolition of site buildings and soil screenings from materials beneath demolished houses/buildings. It was confirmed by Linx that no material had been imported to the site.

Fibre cement sheeting waste was observed in one area of the demolition waste pile (**Photo 12**). Tests results showed the material to be asbestos free. No fibro cement sheets were observed in any other waste materials or any other locations on this area.

Subway Lane property:

Previously (2016):

A motor mechanics/panel beaters workshop building was present facing Subway Lane (**Photo 3**). The ground was relatively flat with a slight fall to the west. The entire area was sealed by concrete.

There were a number of metal lids on the ground surface of the front driveway suggesting evidence of underground tanks (**Photo 3** and **Photo 6**). One of the metal lids was opened and revealed a dip point that was measured and reported a depth to the base of the possible tank of 2.0 metres below ground level (mbgl). There was evidence of an oily liquid at the base of the dip point in the tank. Other metal lids were welded shut and could not be accessed. It was not known if this area was ever used as a service station in the past.

A network of stormwater drainage lines dominated the ground beneath the front of the motor mechanics land.

Currently (2018):

The motor mechanics/panel beaters workshop building has been demolished to slab level (**Photo 13**). Underground tanks are likely to remain under the front driveway of Subway Lane as no ground disturbance has occurred in that area.

A concrete sump pit was observed in the central area of the property (**Photo 14** and **Photo 15**).

No fibro cement sheets were observed anywhere on this area.

Parramatta Road properties:

Previously (2016)

The Parramatta Road area is relatively flat land sloping gently down to the west and contains retail shop buildings that front Parramatta Road. The shops were accessible via a rear lane way that entered from Knight Street (**Photo 7** and **Photo 8**).

Ground surfaces were mainly concrete sealed by building footprints or parking areas apart from the rear access laneway that consists of road base gravel and broken bitumen (**Photo 7** and **Photo 9**).

All buildings were inaccessible.

2 Site Information

Currently (2018)

All buildings within the Parramatta Road area have been demolished (**Photo 16**).

No fibro cement sheets were observed anywhere on this area.

Knight Street properties:

Previously (2016):

This area was not part of the previous work conducted in 2016.

Currently (2018):

Currently the residential flat buildings on #5 and #9 have been demolished to slab level (**Photo 17** and **Photo 18**). A pile of demolition waste was present within #5. The residential flat building on #11 remains present and appears occupied by tenants.

Linx Constructions confirmed (pers. comm. Glenn Francis 17 July 2018) that the materials remaining onsite consist of waste from demolition of site buildings.

No fibro cement sheets were observed in the waste materials or anywhere on this area.

2.3 Site Activities Since 2016

It is understood that since the previous site investigation in 2016, activities onsite have been very limited. All tenants vacated retail and residential dwellings, while the motor mechanics workshop was vacant and unused prior to 2016. Demolition of the majority of site structures occurred in mid-late 2017. Findings of the detailed inspection show negligible surface impacts from demolition activities. No potential asbestos containing materials (ACMs) were observed on the ground surfaces.

In our opinion, it is very unlikely that activities conducted on site since the previous sampling in 2016 would invalidate those test results. Therefore, we have adopted the previous sampling results from 2016 as representative of current site conditions.

2.4 Surrounding Land

The site is bordered by the following land uses:

- North – Parramatta Road then across the road to commercial sites under a B4 land zoning.
- South – Loftus Crescent then the T2 train line (Airport, Inner West and South line).
- East – Retail commercial operations (including a laundromat and possibly combined dry cleaning) then Knight Street.
- West – Retail commercial buildings, then Subway Lane and onto low density residential housing, a car dealership, service and parts facility.

2.5 Environmental Setting

Topography

The site and surrounding lands are generally flat with a slight fall to the west and situated at around 10m above sea level (AHD – Australian Height Datum). Stormwater runoff appears to drain in a westerly direction. There is a large stormwater system running along Subway Lane that connects to an open drainage channel on the north side of Parramatta Road. This channel drains north to Powells Creek.

2 Site Information

Geology and Soils

The site is located on geology described as Triassic period Ashfield Shale comprising black to dark grey shale and laminite (Sydney 1:100,000 Geological Series Sheet 9130, NSW Department of Mineral Resources, 1983). The geological formation correlates well with the soil and rock encountered during this assessment (refer to Borelogs in **Appendix C**).

The soil materials encountered during this assessment were reported to consist of a surface fill material to a depth of approximately 0.5m. Fill material was underlain by natural silty clays to an approximate depth of 2.0-4.0m depth, then shale rock materials.

Groundwater

A review of the NSW DPI Office of Water (DPI-Water) groundwater database (accessed Aug 2018) showed there are four registered groundwater bores within a 500m radius of the site. Details of these registered bore licences are provided below.

Table 2-2 Registered Groundwater Bore Licences

Bore ID	Distance/direction	Date	Depth & SWL ¹	Purpose	Status
GW111479	150m/west	Feb 2011	4.5m/0.9m	Monitoring	Active
GW111480	150m/west	Feb 2011	6.0m/3.07m	Monitoring	Active
GW111481	150m/west	Feb 2011	5.9m/2.7m	Monitoring	Active
GW102670	400m/west	Jul 1993	2.0m/not recorded	Monitoring	Active

(1) Standing Water Level

Acid Sulfate Soils

The site is categorised as Class 5 land in accordance with Strathfield Local Environmental Plan 2012 (<http://maps.strathfield.nsw.gov.au/intramaps80/>). Development consent for acid sulfate soils is required on Class 5 land for works within 500 metres of adjacent Class 1, 2, 3 or 4 land that is below 5 metres Australian Height Datum and by which the watertable is likely to be lowered below 1 metre Australian Height Datum on adjacent Class 1, 2, 3 or 4 land.

The proposed development is unlikely to trigger the need for development consent for acid sulfate soils based on Class 5 works.

2.6 Historical Aerial Photographs

The table below presents details from each aerial photograph reviewed. Historical aerial imagery is presented in **Appendix E**.

In summary, the site has been used for residential purposes on Loftus Crescent since circa 1930, while the Parramatta Road retail buildings have been present since the same time. The motor mechanics workshop was established circa 1960 while large warehouse-style buildings were located on Knight Street prior to 1943 after which residential flat buildings were constructed. Overall there appears to be little historical activity over the site in general that would pose significant contamination issues other than the motor mechanics area and the warehouse buildings on Knight Street prior to 1943.

2 Site Information

Table 2-3 Historical Aerial Imagery Notes

Year	Details
1930 (black & white)	<p>No. 10 Loftus and the residential unit blocks on Knight Street appear to be covered by a warehouse-style building.</p> <p>No. 11 to No. 16 Loftus appear to be residential house buildings with rear yards.</p> <p>The mechanics workshop is not present and this area seems to be vacant or used as an access lane.</p> <p>Subway Lane appears to be a creek/stormwater drainage line.</p> <p>The Parramatta Rd portion is covered by buildings resembling present day structures with the rear access lane also visible.</p>
1943 (black & white)	<p>The buildings on Loftus Cr appear as they do at present.</p> <p>The warehouse-style building on Knight St has been removed and the residential unit blocks have been erected on Knight St appearing as they did recently (prior to some being demolished).</p> <p>The mechanics workshop area is occupied by three small shed structures and appears the ground is unsealed.</p> <p>Subway Lane has been sealed and the drainage line appears covered.</p> <p>The Parramatta Rd buildings appear to be unchanged.</p>
1951 (black & white)	<p>The only change appears to be on the motor mechanics workshop land where the small sheds are gone, and the land appears used as an access lane joining Subway Lane and Knight Street through the rear of the Parramatta Rd buildings. A truck or heavy vehicle appears to be parked on the motor mechanics workshop land.</p>
1961 (black & white)	<p>The only change from the last decade is that a building has been erected to the western side of the motor mechanics workshop land. Vehicles are parked on the street frontage off Subway Lane. It appears that the rear yard of this land is being used as storage or for similar activities.</p>
1972 (black & white)	<p>The site buildings appear similar as they do at present. An extension and new roof to the building on 90-92a Parramatta Rd is visible since the last image.</p>
1982 (colour)	<p>No changes are visible since the last decade. The rear of the motor mechanics is used to park numerous vehicles and possibly a truck.</p>
1994 (colour)	<p>The motor mechanics appears to be using the rear of No. 16 Loftus to park cars, and the rear of the building has been extended with a new shed structure in the eastern corner. No other notable changes have occurred in other areas of the site.</p>
2005 (colour)	<p>No notable changes have occurred.</p>

2 Site Information

Year	Details
Dec 2015 Google Earth imagery (colour)	The site appears unchanged.
2018 Google Earth imagery (colour)	All site buildings have been demolished with the exception of No. 11 Knight Street. No. 7 Knight Street is not within the site boundary and not part of proposed development works.

2.7 Future Land Use

The site is proposed to be developed into three separate high-rise residential apartment buildings on each portion of land with commercial retail on some ground floor areas. The rear access lane will be extended to created Loftus Lane as a dedicated laneway linking Subway Lane and Knight Street. The features of the development include:

- A two-level basement car park to a depth of 6mbgl interlinked underneath the new Loftus Lane link road.
- Retail/commercial outlets occupying the ground floor in particular areas.

The majority of the site area will require bulk earthworks to a depth of at least 6.0mbgl to accommodate the basement car parks, therefore the majority of the existing soils of the site including shallow fill materials, natural soils and shale bedrock will need to be excavated and removed from the site. **Figure 2** identifies areas of the site where deep excavations will occur and where soils will be retained.

Assessment Criteria

The future development of the site will remove the majority of soil materials as a result of bulk earthworks as shown on **Figure 2**. Soils removed as part of basement excavation would not be considered as a contaminated source media. Soils will only be retained along the SP2 zone of Loftus Lane and proposed landscaping and deep soil central areas and fringes along Subway Lane, Loftus Crescent and Knight Street as shown highlighted on **Figure 2**.

The soil criteria adopted for this investigation accounts for soils to be removed from the site as waste materials and therefore waste classification criteria have been used as a substitute for health-based criteria for assessing risks. Health-based land use criteria will only be used to assess residual soils that will remain onsite.

Groundwater and potential vapours may be the only media that presents a potential future risk to residents and receptors.

3.1 Soils

Waste Criteria

The NSW EPA Waste Classification Guidelines 2014 were used in order to provide a waste classification for soils to be removed from basement areas of the site. Classifying wastes into groups that pose similar risks to the environment and human health facilitates their management offsite. These locations included samples collected from BH6, BH9, SB10, SB14, SB15, SB16 and SB19 as shown in Table 3.

ASC NEPM 2013 Criteria

HILs

The ASC NEPM 2013 Health-based Investigation Levels (HILs) for high-density residential land use were used to assess soils to be retained in landscaped areas. These locations included samples collected from BH3, BH5, BH8, SB11, SB17 and SB18 as shown in Table 1.

HILs for commercial/industrial land use were used to assess soils along the dedicated roadway of Loftus Lane. These locations included samples collected from BH1, BH2, BH4, BH7, SB12 and SB13 as shown in Table 2.

Soils within the basement excavation footprint will be removed to a depth of at least 6m and therefore there will be no opportunity for residents to access residual soils in these areas.

HSLs

The ASC NEPM 2013 Health Screening Levels (HSLs) for high-density residential land use and direct contact were used to assess soils to be retained in landscaped areas. These locations included samples collected from BH3, BH5, BH8, SB11, SB17 and SB18 as shown in Table 1.

HSLs for commercial/industrial land use for vapour inhalation and direct contact were used to assess soils along the dedicated roadway of Loftus Lane. These locations included samples collected from BH1, BH2, BH4, BH7, SB12 and SB13 as shown in Table 2.

HSLs for soils were not used in areas within the basement car park given that there will be no vadose zone present as a result of depth of the excavation and likelihood of the basement being submerged in groundwater. The concentration of contaminants in soil samples collected below the water table can be

compromised given the partitioning between phases in saturated conditions. Under this scenario HSLs relevant to groundwater should only be used.

Asbestos HSLs were only used in a qualitative sense given that no asbestos quantification analysis was conducted on samples collected. Analysis was conducted to investigate the presence of asbestos fibres only.

EILs/ESLs

The ASC NEPM 2013 Ecological Investigation Levels and Ecological Screening Levels (EILs and ESLs) for urban residential land use were used to assess soils to be retained in landscaped areas. These locations included samples collected from BH3, BH5, BH8, SB11, SB17 and SB18 as shown in Table 1.

The ASC NEPM 2013 Ecological Investigation Levels and Ecological Screening Levels (EILs and ESLs) were not used in all other areas of the site given that there will be minimal soil environments (i.e. basement areas) or soils will exist under permanently sealed pavements (i.e. roads) that could sustain ecological receptors after development of the site.

Aesthetics

In accordance with the ASC NEPM 2013, the aesthetic state of sites is required to be taken into account and generally relates to the presence of materials with a negligible risk or non-hazardous inert foreign material in soil or fill resulting from anthropogenic sources. Sites that have been assessed as being acceptable from a human health and environmental perspective may still contain such foreign material. An assessment of the site aesthetics requires consideration of the natural state of soil on any given site, and a comparison between it and the soil encountered during investigation works.

In particular, soils on site should not exhibit discolouration (staining), a malodorous nature (odours) or abnormal consistency (rubble and trash).

3.2 Groundwater

The relevant adopted groundwater investigation levels (GILs) were sourced from the ASC NEPM 2013 and supporting documents. The section below provides information on the adopted GILs.

NEPM 2013 HSLs

The ASC NEPM 2013 HSLs have been derived for groundwater in relation to petroleum hydrocarbons; TRH fractions and BTEXN. The approach taken in the development of the HSLs has sought to set a reasonable maximum exposure that corresponds to common scenarios encountered with petroleum based contamination. The HSLs consider the potential risk to human health via the inhalation pathway only. A conservative approach was adopted for groundwater at a shallow depth in a sandy matrix to be representative of site conditions under a high-density land use setting.

ANZECC 2000

The Australian and New Zealand Environment Conservation Council and the Agriculture and Resource Management Council of Australia and New Zealand (ANZECC/ARMCANZ) Water Quality Guidelines (ANZECC 2000 Guidelines) provide trigger values for organic and inorganic chemicals for the protection of freshwater and marine aquatic ecosystems.

For the purposes of this Phase 2, the receiving waters of groundwater discharge would be the marine water ecosystem of Homebush Bay in the Parramatta River, therefore GILs for the protection of marine water environments were adopted.

Australian Drinking Water Guidelines (ADWG) 2011

The National Health and Medical Research Council (NHMRC) and Natural Resource Management Ministerial Council (NRMMC), National Water Quality Management Strategy, ADWG 2011 provides threshold levels for potable water resources. Considering that there are no potable groundwater sources onsite or within surrounding areas, the drinking water criteria were not used for this investigation.

This page intentionally left blank

Methodology

Soil and groundwater sampling locations are presented on Figure 2 (**Appendix A**). The field sampling activities conducted in 2016 were supplemented by additional sampling of soils for this Phase 2 to account for the additional land included within the site along Knight Street. It was considered that sufficient groundwater sampling had been conducted in 2016 to represent groundwater quality and therefore did not require further investigation in 2018.

4.1 Soil Sampling

Details of the soil sampling program are presented below.

Table 4-1 Soil Sampling Works Summary

Activity/Item	Details
Date of Field Activities	22 nd and 29 th March 2016 4 th July 2018
Service Location	Dial Before You Dig plans were reviewed. A certified utility locator surveyed the site before drilling of the soils was conducted.
Concrete Coring	<u>2016:</u> Four bore locations were cored through the concrete to access underlying soils.
Bores Drilled and Sampling	<p><u>2016:</u></p> <p>A total of 6 soil bores were completed using a drilling rig to depths of 9.0 mbgl. The bores were drilled as part of a combined geotechnical investigation being undertaken at the site. Four bores were converted into groundwater monitoring wells.</p> <p>A total of 5 soil bores were drilled using a hand auger to depths of approximately 1.0m into natural soils.</p> <p>Sampling locations were labelled BH1 – BH9 and SB10 – SB11.</p> <p>The 11 soil sampling locations meets the minimum recommended number in accordance with NSW EPA Sampling Design Guidelines, 1995 – Table A for an area of approximately 4,000m².</p> <p><u>2018:</u></p> <p>A total of 8 soil bores were drilled using a hand auger to depths of approximately 1.0m into natural soils.</p> <p>Sampling locations were labelled SB12 – SB19.</p> <p>The additional 8 soil sampling locations meets the minimum recommended number in accordance with NSW EPA Sampling Design Guidelines, 1995 – Table A for an area of approximately 2,000m² that covers the additional site area of properties along Knight Street.</p>

Activity/Item	Details
Soil Logging	Soil and rock type classifications and descriptions are based on Unified Soil Classification System (USCS) and on Australian Standard AS4482.1-1997 “Guide to sampling and investigation of potentially contaminated soil”. Soil descriptions for the lithology encountered onsite are presented in the borelogs in Appendix C . Borelogs from a geotechnical investigation (D. Katauskas 2016) are also included.
Soil Sampling	Soil samples were taken directly from the soil cuttings using nitrile gloves that were changed between samples. All soil samples were placed in clean, laboratory-supplied acid washed solvent rinsed glass jars. Asbestos samples were placed in laboratory supplied zip-lock bags.
Soil Screening	<u>2016:</u> Soil samples were field screened for the potential presence of hydrocarbons/volatile organic carbons (VOCs) using a photo-ionisation detector (PID) that was calibrated to a known concentration (100 parts per million (ppm)) of iso-butylene calibration gas. Calibration records are presented in Appendix F . <u>2018:</u> No PID field screening was conducted.
Decontamination Procedures	Reusable sampling equipment was decontaminated between sampling locations with potable water and a solution of Decon 90.
Sample Preservation	Samples were stored on ice in an insulated cool box whilst onsite and during transit to the laboratory. All samples analysed for the contaminants of concern were submitted and analysed within the required holding period.
Disposal of Soil Cuttings	Soil cuttings were used to backfill boreholes once samples had been collected. Surplus soils were left at the site.
Disposal of consumable materials	Single use materials used during sampling were placed into garbage bags and disposed offsite.

4.1.1 Soil Sample Analysis

A total of 30 soil samples were collected and analysed by ALS Environmental under NATA accreditation. The soil analysis included:

2016:

- 18 primary soil samples were analysed for TPH/TRH, BTEXN, PAH, and 8 heavy metals.
- 11 soil samples were analysed for the presence of asbestos.
- 3 soil samples were analysed for VOCs.
- 2 soil samples were analysed for heavy metal leaching capacity (TCLP).
- 2 soil samples were analysed for BaP leaching capacity (TCLP).
- 2 field quality control (Q01 and Q02) duplicate sample was analysed for TPH/TRH, BTEXN, PAH, and 8 heavy metals.
- 1 trip blank was analysed for BTEXN.

2018:

- 12 primary soil samples were analysed for TPH/TRH, BTEXN, PAH, and 8 heavy metals.
- 7 soil samples and 1 fragment material were analysed for the presence of asbestos.

- 2 soil samples were analysed for heavy metal leaching capacity (TCLP).
- 2 soil samples were analysed for BaP leaching capacity (TCLP).
- 2 field quality control (QC04 and QC05) duplicate sample was analysed for TPH/TRH, BTEXN, PAH, and 8 heavy metals.
- 1 trip blank was analysed for BTEXN.

4.2 Groundwater Sampling

Details of the groundwater sampling program conducted in 2016 are presented below.

Table 4-2 Groundwater Sampling Works Summary

Activity / Item	Details
Date of Field Activities	Groundwater well construction and development: 22 nd and 28 th March 2016. Groundwater sampling: 5 th April 2016.
Well Construction	Four temporary groundwater wells were constructed at each of the following locations: BH1, BH4, BH5 and BH6. Each was secured at the ground surface with a metal gatic cover. Construction materials consisted of 50mm uPVC casing/screen, 0.4mm aperture screen, 2mm washed sand, and bentonite pellet seal. Each new groundwater well was developed using a disposable bailer to remove silt and sediment.
Well Gauging	The groundwater wells were gauged using an oil/water interface probe for: <ul style="list-style-type: none"> • depth to groundwater (SWL – Standing Water Level) • total depth • presence of phase separated hydrocarbons (PSH).
Well Purging	Monitoring wells were purged using a disposable bailer. Field parameter measurements were taken using a water quality meter for pH, dissolved oxygen (DO), reduction/oxidation potential (redox), temperature and electrical conductivity (EC). Field data sheets showing purging details are presented in Appendix F .
Sampling Method	Four groundwater samples were collected using a disposable bailer. Groundwater samples were labelled BH1, BH4, BH5 and BH6.
Sample Preservation	Samples were placed in laboratory-supplied bottles containing appropriate preservatives. Samples were stored on ice in a cooler while on-site and in transit to the laboratory. Samples collected for metals analysis were filtered onsite through a 0.45 µm filter cartridge and put in to preserved laboratory supplied bottles.
Decontamination Procedure	The oil / water interface probe was washed in Decon 90 solution and rinsed with potable water between measurements. The water quality meter was rinsed in potable water between sampling.
Disposal of consumable materials	Single use materials were placed in garbage bags and disposed off-site.

4.2.1 Groundwater Sample Analysis

A total of 4 primary groundwater samples and 1 field duplicate sample (QA) were collected in 2016. Samples were submitted to ALS Environmental for analysis for TPH/TRH, BTEXN, PAH, 8 heavy metals and VOCs. One trip blank sample was analysed for BTEXN.

Two groundwater samples were reanalysed for TPH/TRH with silica gel clean-up.

4.3 Quality Assurance and Quality Control

The Phase 2 works were completed following standard operating procedures for conducting site contamination investigations. Standards followed included:

- General field documentation
- Health and safety
- Use of Personal Protective Equipment (PPE)
- Representative sample collection and labelling
- Equipment calibration
- Chain of Custody documentation for analytical samples
- Decontamination
- Collection of quality control samples (may include: intra laboratory, inter laboratory, rinsates, blanks, spikes).

The data validation guidelines adopted are based upon the following data validation guidance documents published by the United States Environmental Protection Agency (USEPA):

- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (EPA 540-R-10-011, dated January 2010)
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (EPA 540/R-99/008, dated June 2008)
- National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM 2013).

The process involves the checking of analytical procedure compliance and the assessment of the accuracy and precision of analytical data from a range of quality control measurements generated from both field sampling and analytical programs. Specific elements that have been checked and assessed for this project include:

- preservation and storage of samples upon collection and during transport to the laboratory
- holding times
- use of appropriate analytical procedures
- required LOR
- frequency of conducting quality control measurements
- laboratory blanks
- field duplicates
- laboratory duplicates
- matrix spike/matrix spike duplicates (MS/MSDs)
- surrogates (or System Monitoring Compounds)
- the occurrence of apparently unusual or anomalous results, e.g. laboratory results that appear to be inconsistent with field observations or measurements.

Results and Discussion

5.1 Site Geology

The general geology at the site is presented in the table below, giving a general description of materials across the site based on the findings of this Phase 2. Borelogs are presented in **Appendix C**.

Table 5-1 General Site Geology

Approximate Depths	General Description
Pavement	Concrete or hardstand covering large areas of the site including former/current building footprints.
0.0 to approx. 0.5 mbgl	Fill: Shaly/gravelly clay mixtures, clayey gravels, black charcoal gravels and black ash gravels in some areas, silty sands, crushed sandstone.
0.5 to approx. 2.0 - 5.0 mbgl	Natural: Silty Clay, variable plasticity, moist, brown/grey, red mottling.
Starting at approx. 2.0 to 5.0 mbgl	Bedrock: Weathered shale and shale.

5.2 Field Observations

Field observations indicated the following:

- The site was characterised by a number of buildings in 2016. No sampling of soils could be conducted within the footprint of any of the buildings or inaccessible areas at that time.
- Metal lid covers (**Photo 3** and **Photo 6**) located in the forecourt parking area of the motor mechanics workshop is evidence of underground tanks being present beneath this area. The tanks will need to be removed and surrounding soils validated.
- A small concrete pit is located within the former mechanics/panel beater workshop (**Photo 14**). Once the slab has been demolished the localised soils should be inspected for signs of contamination, and if so, additional sampling would be warranted to quantify contamination risk.
- No odours were observed at any sampling locations and PID readings were not elevated.
- No potential ACM sheeting or fragments were observed on the ground surface anywhere onsite. One sample of fibre cement was collected from a small pile of demolition rubble but was shown to be asbestos free.
- Fill material was generally a thin surface layer of varying quality, showing no significant gross impacts.
- Black granular materials in the surface fill was observed at some locations suggesting charcoal or ashy gravel material. These materials were observed at BH7, BH8, SB10, SB11, SB12, SB13, SB14, SB15, SB16, SB18(likely) and SB19.
- Natural soils were typically clays above natural shale rock, showing no indication of contamination.
- Groundwater was encountered at the base of the clay formation or within the weathered shale rock material and recharge was very slow.

5.3 Soil Results and Discussion

Soil analytical data are presented in Table 1, Table 2, Table 3 and Table 4 of **Appendix B** and in the laboratory reports contained in **Appendix H**.

5.3.1 Retained Soils in Landscaped Areas

The results presented in Table 1 show that some contaminants reported results in excess of the adopted assessment criteria for soils to be retained at the site in landscaped areas. The following detections exceeded criteria:

HILs

- BH5_0.5-0.6m in fill material that reported BaP TEQ (4.9mg/kg) exceeding the HIL B criterion (4mg/kg).
- SB11_0.3-0.5 in fill material that reported BaP TEQ (5.2mg/kg) exceeding the HIL B criterion (4mg/kg).
- SB18_0.2-0.3 in fill material that reported BaP TEQ (7.0mg/kg) exceeding the HIL B criterion (4mg/kg).

ESLs

- BH5_0.5-0.6 in fill material that reported BaP (3.2mg/kg) and TRH (>C10-C16) (300mg/kg) exceeding the ESL urban criteria (0.7mg/kg and 300mg/kg, respectively).
- BH8_0.1 in fill material that reported BaP (0.9mg/kg) and TRH (>C10-C16) (540mg/kg) exceeding the ESL urban criteria (0.7mg/kg and 300mg/kg, respectively).
- SB11_0.3-0.5 in fill material that reported BaP (3.6mg/kg) exceeding the ESL urban criterion (0.7mg/kg).
- SB18_0.2-0.3 in fill material that reported BaP (4.9mg/kg) and TRH (>C10-C16) (370mg/kg) exceeding the ESL urban criteria (0.7mg/kg and 300mg/kg, respectively).

Aesthetics

The identification of charcoal and ashy gravels at numerous locations including BH8, SB11 and SB18 causes an unacceptable aesthetic issue for retained soils in landscaped areas.

Human Health and Ecological Risks

The detectable concentration of carcinogenic BaP TEQ at BH5, SB11 and SB18 in surface fill layers warrant remediation to remove human health contamination risks and unacceptable aesthetic issues within landscaped areas of the future development.

The likely cause of soil contamination is the charcoal/ashy gravels spread throughout the surface/near surface fill materials. There are no discernible contamination hotspots.

The calculated 95% Upper Confidence Limit (UCL) of the arithmetic mean concentration for BaP TEQ was 4.59mg/kg which exceeds the adopted HIL of 4mg/kg; as such all surface/near surface fill material within proposed landscaped areas impacted with charcoal/ash gravels poses an unacceptable risk to human health warranting remediation. The 95% UCL calculation was conducted using ProUCL software and is presented in **Appendix G**.

Detections of BaP and TRH at the same locations above pose potential ecological risks to terrestrial receptors; however, rectification of risks to human health will also remedy ecological risks.

5.3.2 Retained Soils under Loftus Lane

The results presented in Table 2 show that no contaminants reported results in excess of the adopted health investigation levels in soils to be retained at the site under Loftus Lane, the exception being:

- BH7_0.2m in the surface fill material that reported BaP TEQ (50.4mg/kg) exceeding the HIL D criterion (40mg/kg).

The BaP impacts are attributed to charcoal/ash gravels as the contamination source in poor quality fill material from historical activities. The fill materials at and around BH7 are unsuitable and require management or removal, however the impacts are expected to be localised and limited in extent to the thin fill layer under the road base gravels and above the natural clays. It is expected that the soils within the new roadway of Loftus Lane that will be constructed over the area of BH7 will require relaying to meet engineering design specifications, as such the impacted fill at BH7 will be removed to meet the specifications regardless.

The indicative waste classification for impacted fill at BH7 is governed by the elevated concentrations of Lead (Pb) (428mg/kg) and BaP (35.1mg/kg) and would be classified as Hazardous Waste if soils are to be removed offsite and disposed at a landfill. This waste classification is preliminary and based on total concentrations only. The classification should be verified with leachable concentration (TCLP) results at the time of bulk earthworks prior to removal from the site in accordance with the NSW EPA Waste Classification Guidelines, 2014.

Sampling locations BH1 and BH2 are proximal to possible underground tanks. The soil results for these locations show no impacts from the tanks.

5.3.3 Excavated Soils for New Basement Areas

Table 3 shows that surface fill materials within basement footprints to be excavated and removed from the site would generally indicate a waste classification of General Solid Waste; the exception to this would be:

- BH9_0.2: Hazardous Waste based on the concentration of Pb (667mg/kg) in the surface fill.

These waste classifications are preliminary in nature and based on total concentrations only. Waste classifications should be verified with leachable concentration (TCLP) results at the time of earthworks prior to removal from the site in accordance with the NSW EPA Waste Classification Guidelines, 2014.

Table 4 presents leaching results of fill materials at BH6 and SB16. The results show a negligible leaching capacity and are indicative of the leaching potential of general fill materials that will be excavated to make way for the basement car parks. The fill materials at BH6 and SB16 would be classified as General Solid Waste (GSW) in accordance with the NSW EPA Waste Classification Guidelines, 2014; however, verification sampling is needed at the time of bulk earthworks.

Table 3 shows that natural soil/rock materials within the new basement footprints to be excavated are not impacted and show natural concentrations of analytes. As such the natural soils/rock can be indicatively classified as Virgin Excavated Natural Material (VENM) within the meaning provided in Schedule 1 of the Protection of the Environment Operations Act 1997.

Table 4 presents soil leaching results for BH2 in natural soils, showing that the natural soils beneath the proposed roadway of Loftus Lane do not leach. These results are also a reflection of the potential leaching capacity of natural soils that are to be excavated and disposed offsite (i.e. for car park basement areas).

Residual natural soils/rock will exist below the basement car park floor (i.e. greater than 6m depth) and will not be accessible to any residents of the site. Regardless, the analytical results show the natural

soils/rock contain no elevated concentrations of contaminants, and pose no risk to human health and are suitable to remain on the site.

5.4 Site Hydrogeology

The following table presents details of site hydrogeology.

The Standing Water Level (SWL) is a reflection of the potentiometric head level of the watertable. As a result, the groundwater level may be much deeper and reside in the shale rock material rather than at the depth of the measured SWL. No shallow groundwater was observed during drilling of the boreholes which supports this assertion. The elevated electrical conductivity readings are a reflection of the saline environment governed by the natural shale bedrock indicating that groundwater is likely to be present in the shale bedrock rather than perched in the shallower soils.

Table 5-2 Site Hydrogeology

Activity / Item	Description		
	Well ID	SWL (mbtoc)	Bore Depth (mbtoc)
Groundwater Occurrence	BH1	4.14	5.81
	BH4	2.69	6.86
	BH5	2.11	8.72
	BH6	1.74	5.0
Occurrence of PSH	No PSH was measured in the groundwater wells and no hydrocarbon sheens or odours were observed.		
Field Parameter Measurement	At the time of sampling the following measurements were taken: <u>BH1:</u> EC (16.4mS/cm), pH (5.1), Temp (23.9 °C), Redox (137mV), DO (4.3mg/L). The water was clear with slight cloudiness, no odours. <u>BH4:</u> EC (8.21mS/cm), pH (6.3), Temp (21.4 °C), Redox (115mV), DO (5.1mg/L). The water was very dark grey and turbid, no odours. <u>BH5:</u> EC (15.3S/cm), pH (5.6), Temp (23.7 °C), Redox (99mV), DO (2.4mg/L). The water was very turbid grey/black with an anoxic/salty odour. <u>BH6:</u> No readings taken – too silty.		

5.5 Groundwater Results and Discussion

Groundwater analytical results for this Phase 2 are presented in Table 5 (**Appendix B**) and in the laboratory reports contained in **Appendix H**.

The results show that no contaminants reported results in excess of the adopted GILs, the exception being the following:

- Cadmium at BH1 (0.0576mg/L) and BH5 (0.001mg/L).
- Copper at BH1 (0.026mg/L) and BH4 (0.002mg/L).
- Nickel at BH1 (0.182mg/L), BH4 (0.057mg/L), BH5 (0.316mg/L) and BH6 (0.01mg/L).
- Zinc at BH1 (0.397mg/L), BH4 (0.114mg/L) and BH5 (0.872mg/L).
- Phenanthrene at BH6 (1.8ug/L).

It is noted that onsite fill/soil materials show no excessively elevated levels of the metals as was detected in groundwater, and as such there appears to be limited contamination source of these analytes originating from the site. Elevated levels of metals, especially copper, nickel and zinc, are common in galvanised and metallic structures in urbanised areas and are a potential source.

The collected groundwater samples were generally sediment laden and potentially attributed to anomalous results. Although phenanthrene (a constituent of PAH) was detected at elevated concentrations in the surface fill proximal to BH6 (at BH7 – 60.6mg/kg), these compounds are relatively insoluble and non-leaching, as represented by ashy samples from SB18 that showed non-leaching capacity for BaP (refer to Table 4). It is unlikely that the detection of phenanthrene in the groundwater at BH6 would be caused by leaching ash fill materials. Regardless, the detections are considered marginal and no cause for concern. The elevated levels may also be attributed to ambient sources within the highly urbanised area of Homebush and as such are not considered to be of significance that warrants further assessment or precludes use of the site for its intended use.

Other organic contaminants that were detected in groundwater, albeit below the adopted GILs, included:

- TRH F2 (>C10-C16) at BH5 (210ug/L) and BH6 (220ug/L).
- TRH (>C16-C34) at BH5 (1,540ug/L) and BH6 (1,190ug/L).
- TRH (>C34-C40) at BH5 (420ug/L) and BH6 (310ug/L).
- Chloroform at BH6 (9ug/L).
- Toluene at BH5 (4ug/L) and BH6 (4ug/L).

Shale bedrock is a known source of shale oil and commonly attributes to detections of longer chain hydrocarbons (i.e. >C16) in samples of natural soil and groundwater. Hydrocarbon impacts listed above are not related to the underground tanks in the forecourt of the motor mechanics because groundwater proximal to the underground tanks at BH1 shows no impacts.

Groundwater samples reporting detections of hydrocarbons were reanalysed with silica gel clean-up (TRH-silica), after which the results for TRH F2 (>C10-C16) were reported below the LOR while other TRH longer chain fractions (i.e. >C16) remained relatively similar in concentration. The longer chain hydrocarbons (>C16) are therefore of a petrogenic source, such as shale oils. The detectable hydrocarbons in the groundwater are well below the GILs and pose negligible risk to human health, and are attributed to the natural oils from the shale bedrock. Given the natural origins of the hydrocarbon, ecological receptors would not be placed at risk.

Detections of chloroform and toluene are considered anomalies as they are marginally above the LOR and significantly below the GIL and pose no risk to receptors.

Groundwater well BH6 was positioned proximal to the offsite laundromat (potential dry-cleaning operation) on the adjoining eastern boundary (**Figure 2**). Results from BH6 show no impacts from dry cleaning chemicals in the groundwater. However, the detection of chloroform could be residual impacts from the use of bleaches by the laundromat offsite, although this assumption has not been verified.

5.6 Conceptual Site Model

A conceptual site model (CSM) is a representation of site-related information regarding contamination sources, receptors and exposure pathways between them.

A CSM was developed in consideration of the existing results and site information. The CSM takes into account the future use of the site under the proposed development.

This page intentionally left blank

Table 5-3 Conceptual Site Model

Source of Contamination	Contaminants of Concern	Impacted Media	Exposure Route or Pathway	Receptor	Linkage
Primary Source: Existing fill material within proposed landscaped areas	Benzo(a)Pyrene (BaP) TRHs	Soils	Ingestion (soil) Inhalation (dust) Dermal contact (soil)	Future residents Construction/maintenance workers Terrestrial biota	<u>Likely:</u> Contaminated surface fill materials across soils to be retained onsite in landscaped areas are impacted by charcoal and ashy gravels. The contaminated fill would be readily accessible if left in place. Health risks to human and terrestrial receptors is unacceptable and warrants remediation.

This page intentionally left blank

Quality of Analytical Data

Analytical data validation is the process of assessing whether the data is in compliance with method requirements and project specifications. The primary objective of this process is to ensure that data of known quality are reported, and to identify if data can be used to fulfil the overall project objectives.

On the basis of the analytical data validation procedure employed, the overall quality of the soil and groundwater analytical data produced is considered to be of an acceptable standard for interpretive use. The table below provides a summary of the data validation.

Table 6-1 Data Quality

Requirement	Compliance	Comments
Field Duplicates	Yes	Intra-laboratory duplicate samples were collected by splitting a sample into the primary and duplicate sample containers. At least 1 duplicate per 10 primary samples was analysed for both soil and water samples.
Blanks	Yes	Trip blank samples were analysed for soil and water. Results reported non-detectable concentrations.
RPDs	Yes	All calculated RPDs fall within the acceptable range of <50%. Acceptable exception is when concentrations are relatively low (i.e. within 10-20 times LOR) which can show higher RPDs. Where concentrations of either sample is <LOR or <10 times the LOR, then no RPD was calculated.
Sampling equipment properly decontaminated	Yes	Disposable equipment used. Probe, pump, water quality meter and hand auger decontaminated between sampling locations.
Rinsate sample	N/A	Disposable sampling equipment was generally used. No rinsate was collected from the hand auger.
Sample Preservation	Yes	Samples were properly preserved. Samples were compliant with required storage temperature.
Samples delivered to laboratory within sample holding times.	Yes	Confirmed from COCs and laboratory reports. There were two minor non-compliances with holding times for MAHs, however these were marginal and would not impact on the representativeness of the samples.
Equipment Calibration	Yes	Refer to Appendix F .
Analytical procedures	Yes	All procedure are NATA accredited. There were a few non-compliant outliers for laboratory duplicate frequency analysis; however, this was considered acceptable under their internal QC.

Requirement	Compliance	Comments
SOP and competent field personnel	Yes	Sampling procedures follow industry standards, and field staff (Adam Sullivan – 20 years' experience) were competent in sampling methods and QA/QC protocols.

Conclusion and Recommendations

Sullivan-ES make the following conclusions based on the findings of this revised Phase 2, subject to the report limitations presented in Section 9:

Site History and Conditions

- Historical aerial photos show that the site has been used for residential purposes on Loftus Crescent since circa 1930, while the Parramatta Road retail buildings have been present since the same time. The motor mechanics workshop was established at 2 Subway Lane circa 1960 while large warehouse-style buildings were located on Knight Street prior to 1943 after which residential flat buildings were constructed.
- Overall there appears to be little historical activity over the site in general that would pose significant contamination issues other than the motor mechanics/panel beaters workshop and the warehouse buildings on Knight Street prior to 1943. It is not known if the motor mechanics/panel beaters workshop was ever used as a service station in the past.
- Based on the findings of a detailed site inspection and review of site activities since 2016, it was found to be very unlikely that activities conducted on site since the previous sampling in 2016 would invalidate those test results. As such, test results from 2016 were adopted for reporting in this Phase 2.

Soils and Contamination Sources

- The site soils generally comprise shallow layers of fill material underlain by natural clays, followed by competent shale bedrock at approximately 2.0-5.0 mbgl. No perched groundwater was encountered as groundwater resides in the natural deeper clay/shale strata.
- Black granular materials in the surface fill layers was observed at a number of sampling locations indicating charcoal or ashy gravel material.
- Metal lid covers located in the forecourt parking area of the motor mechanics workshop is evidence of underground tanks being present beneath this area. The tanks will need to be removed and surrounding soils validated. Soil and groundwater sampling results show no detection of contaminants proximal to the tanks.
- A small concrete pit is located within the former mechanics/panel beater workshop. Once the slab has been demolished the localised soils should be inspected for signs of contamination, and if so, additional sampling would be warranted to quantify contamination risk.
- Detectable concentrations of the contaminant BaP TEQ over the human health land use criteria at sampling location BH5, SB11 and SB18 is caused by charcoal/ash gravels warranting remediation to remove human health contamination risks and unacceptable aesthetic issues within landscaped areas of the future development.
- The calculated 95% Upper Confidence Limit (UCL) of the arithmetic mean concentration for BaP TEQ was 4.59mg/kg which exceeds the adopted human health criteria of 4mg/kg, as such all surface/near surface fill material impacted with charcoal/ash gravels within proposed landscaped areas of the development poses an unacceptable risk to human and ecological health warranting remediation.
- All soils to be retained onsite under the new roadway of Loftus Lane meet the adopted human health investigation criteria for such land use under a commercial/industrial setting.
- The exception to this is the fill material at sampling location BH7 which is impacted by PAHs and attributed to the charcoal/ash gravels. The impacts are expected to be localised in the immediate

area around BH7. The impacted fill material in this area will be removed regardless to construct the new Loftus Lane roadway over BH7.

- The indicative waste classification for impacted fill at BH7 is Hazardous Waste, however this is a preliminary classification based on total concentrations only. At the time of bulk earthworks and prior to removal from the site, waste classifications should be verified with leachable concentration (TCLP) results in accordance with the NSW EPA Waste Classification Guidelines, 2014.
- Fill materials to be excavated for the new car park basements can be removed offsite under an indicative waste classification as either General Solid Waste or Hazardous Waste. However, as before, these waste classifications are preliminary and based on total concentrations only. At the time of bulk earthworks and prior to removal from the site, any waste classifications must be verified with leachable concentration (TCLP) results in accordance with the NSW EPA Waste Classification Guidelines, 2014.
- Natural soils and bedrock to be excavated for the new car park basements can be removed offsite as Virgin Excavated Natural Material (VENM) as defined in Schedule 1 of the Protection of the Environment Operations Act 1997.
- Residual natural soils and rock remaining after bulk earthworks contains no elevated concentrations of contaminants and poses no risk to human health and are therefore suitable to remain on the site.

Groundwater

- Detections of contaminants (predominately metals) in groundwater is attributed to endemic urban sources given that there are unlikely to be any related contamination sources of this nature on the site.
- Detections of hydrocarbons in the groundwater is attributed to the naturally occurring longer chain petrogenic sources in the shale bedrock. The concentrations are reported below the health screening levels.
- Low level detection of contaminants in groundwater are not considered a cause for concern that would warrant further assessment or precludes use of the site for its intended use.
- Groundwater well BH6 was positioned proximal to the laundromat (potential dry cleaning operation) on the adjoining eastern boundary. Results from BH6 show no impacts from dry cleaning chemicals in the groundwater. However, the low-level detection of chloroform could be residual impacts from the use of bleaches by the laundromat offsite, although this assumption has not been verified.

Recommendations

- Prepare a Remedial Action Plan (RAP) to address the identified soil contamination within proposed landscaped areas and document protocols for waste classification of soil/fill to be removed offsite. The RAP should be prepared by a suitably competent consultant specialising in contaminated land management.
- Underground tanks located in the forecourt parking area of the motor mechanics workshop are to be removed in accordance with Australian Standard methods and the soils validated in accordance with the Protection of the Environment (Underground Petroleum Storage System) Regulations 2014. The tank decommissioning works should be included with the RAP.
- Once the slab of the motor mechanics workshop has been demolished, the localised soils around the concrete sump pit should be inspected for signs of contamination, and if so, additional sampling would be warranted to quantify contamination risks particular to this area. These details should be documented in the RAP.

Limitations

Sullivan Environmental Sciences Pty Ltd (Sullivan-ES) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of Statewide Planning and only those third parties who have been authorised in writing by Sullivan-ES to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

Where this Report indicates that information has been provided to Sullivan-ES by third parties, Sullivan-ES has made no independent verification of this information except as expressly stated in the Report. Sullivan-ES assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 22 March 2016 - 9 June 2016 (initial Phase 2 sampling) and the 4 July 2018 – 13 September 2018 (recent Phase 2 sampling) and is based on the conditions encountered and information reviewed at the time of preparation. Sullivan-ES disclaims responsibility for any changes that may have occurred after this time.

Investigations undertaken in respect of this Report are constrained by the particular site conditions, such as the location of buildings, services and vegetation. As a result, not all relevant site features and contamination may have been identified in this Report, in particular under site buildings and other inaccessible areas as noted in this Report.

Subsurface conditions can vary across a particular site and cannot be exhaustively defined by the investigations described in this Report.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by Sullivan-ES.

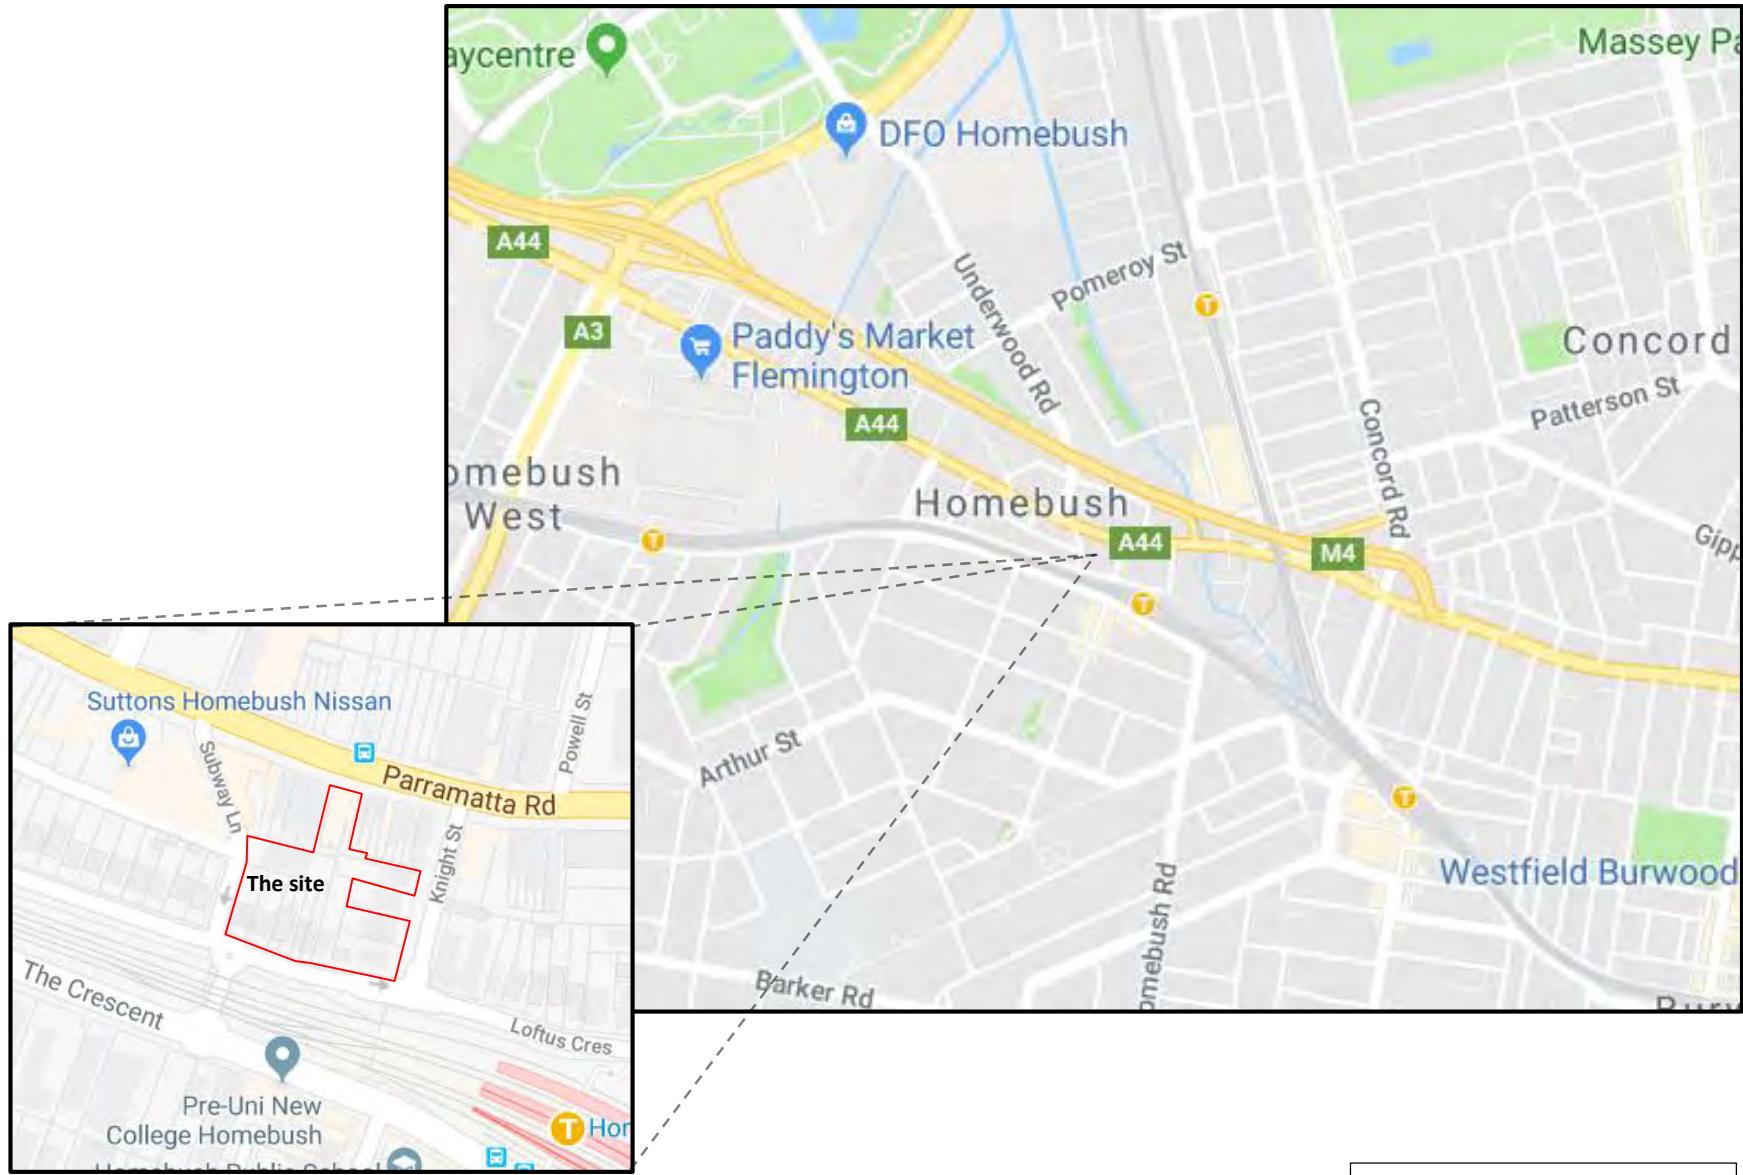

To the extent permitted by law, Sullivan-ES expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. Sullivan-ES does not admit that any action, liability or claim may exist or be available to any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Appendix H Laboratory Analytical Reports

CERTIFICATE OF ANALYSIS

Work Order	: ES1607018	Page	: 1 of 29
Client	: SULLIVAN ENVIRONMENTAL SCIENCES	Laboratory	: Environmental Division Sydney
Contact	: ADAM SULLIVAN	Contact	:
Address	: PO Box 5248 TURRAMURRA NSW 2074	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: SES_442	Date Samples Received	: 31-Mar-2016 14:00
Order number	: ----	Date Analysis Commenced	: 01-Apr-2016
C-O-C number	: ----	Issue Date	: 07-Apr-2016 16:38
Sampler	: ----		
Site	: ----		
Quote number	: ----		
No. of samples received	: 27		NATA Accredited Laboratory 825
No. of samples analysed	: 21		Accredited for compliance with ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Christopher Owler	Team Leader - Asbestos	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
RICHARD TEA	Lab technician	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: Negative results for vinyl tiles should be confirmed by an independent analytical technique.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR.
Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

Project	: SES_442	Date Samples Received	: 31-Mar-2016
Order number	: ----	Date Analysis Commenced	: 01-Apr-2016
C-O-C number	: ----	Issue Date	: 07-Apr-2016
Sampler	: ----		
Site	: ----		
Quote number	: ----		
No. of samples received	: 27		NATA Accredited Laboratory 825
No. of samples analysed	: 21		Accredited for compliance with ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Christopher Owler	Team Leader - Asbestos	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
RICHARD TEA	Lab technician	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: SOIL

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sampler	: ----	No. of samples received	: 27
Order number	: ----	No. of samples analysed	: 21

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Regular Sample Surrogates

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: SOIL

Evaluation: ✗ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM (2013) Schedule B(3)
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Leachable Mercury by FIMS	EG035C	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the TCLP solution. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40.
Volatile Organic Compounds	EP074	SOIL	In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 501)
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
TCLP for Non & Semivolatile Analytes	EN33a	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na ₂ SO ₄ and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.
- Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).
- Asbestos analysis will be conducted by ALS Newcastle.
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

QUALITY CONTROL REPORT

Work Order	: ES1607425	Page	: 1 of 11
Client	: SULLIVAN ENVIRONMENTAL SCIENCES	Laboratory	: Environmental Division Sydney
Contact	: ADAM SULLIVAN	Contact	:
Address	: PO Box 5248 TURRAMURRA NSW 2074	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: SES_442	Date Samples Received	: 06-Apr-2016
Order number	: ----	Date Analysis Commenced	: 07-Apr-2016
C-O-C number	: ----	Issue Date	: 12-Apr-2016
Sampler	: ADAM SULLIVAN		
Site	: ----		
Quote number	: ----		
No. of samples received	: 6		NATA Accredited Laboratory 825
No. of samples analysed	: 6		Accredited for compliance with ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: ----	No. of samples analysed	: 6

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

Matrix: WATER

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
PAH/Phenols (GC/MS - SIM)	0	11	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	13	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	11	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	13	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER

Evaluation: ✘ = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.
- Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

Quote number	: ----		
No. of samples received	: 6		NATA Accredited Laboratory 825
No. of samples analysed	: 6		Accredited for compliance with ISO/IEC 17025.

NATA Accredited Laboratory 825
Accredited for compliance with
ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

- This report has been amended and re-released to allow the reporting of additional analytical data, silica gel TPH requested for samples BH5 and BH6.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

Amendment	: 1		
Client	: SULLIVAN ENVIRONMENTAL SCIENCES	Laboratory	: Environmental Division Sydney
Contact	: ADAM SULLIVAN	Contact	:
Address	: PO Box 5248 TURRAMURRA NSW 2074	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: SES_442	Date Samples Received	: 06-Apr-2016
Order number	: ----	Date Analysis Commenced	: 07-Apr-2016
C-O-C number	: ----	Issue Date	: 18-Apr-2016
Sampler	: ADAM SULLIVAN		
Site	: ----		
Quote number	: ----		
No. of samples received	: 6		NATA Accredited Laboratory 825
No. of samples analysed	: 6		Accredited for compliance with ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- NO Method Blank value outliers occur.
- NO Duplicate outliers occur.
- NO Laboratory Control outliers occur.
- NO Matrix Spike outliers occur.
- For all regular sample matrices, NO surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- NO Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

Matrix: WATER

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
PAH/Phenols (GC/MS - SIM)	0	11	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	13	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fractions Only (after Silica Gel Cleanup)	0	2	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	11	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	13	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fractions Only (after Silica Gel Cleanup)	0	2	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER

Evaluation: ✘ = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: WATER

Evaluation: ✘ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH - Semivolatile Fractions Only (after Silica Gel Cleanup)	EP071-SVSG	WATER	In house: Referenced to USEPA SW 846 - 8015A Sample extracts cleaned up using silica gel and are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C36. This method is compliant with NEPM (2013) Schedule B(3) (Method 506.1)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3). ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.
- Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Gerrad Morgan	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Shaun Spooner	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: Negative results for vinyl tiles should be confirmed by an independent analytical technique.
- EG005: Poor precision was obtained for Zinc on sample ES1819838-1. Results have been confirmed by re-extraction and reanalysis.
- EG005: Poor precision was obtained for Zinc on sample ES1819891-31. Results have been confirmed by re-extraction and reanalysis.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR.
Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Gerrad Morgan	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Shaun Spooner	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- NO Method Blank value outliers occur.
- NO Laboratory Control outliers occur.
- NO Matrix Spike outliers occur.
- Duplicate outliers exist - please see following pages for full details.
- Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers : Analysis Holding Time Compliance

- NO Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: SOIL

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005T: Total Metals by ICP-AES	ES1819838--001	Anonymous	Zinc	7440-66-6	33.4 %	0% - 20%	RPD exceeds LOR based limits
EG005T: Total Metals by ICP-AES	ES1819891--031	Anonymous	Zinc	7440-66-6	23.3 %	0% - 20%	RPD exceeds LOR based limits

Regular Sample Surrogates

Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	7	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM (2013) Schedule B(3)
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Leachable Mercury by FIMS	EG035C	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the TCLP solution. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
TCLP for Non & Semivolatile Analytes	EN33a	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na ₂ SO ₄ and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.
- Asbestos analysis will be conducted by ALS Newcastle.
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component
