

Background / Visions

The landscape includes a diverse range of landscaped spaces, each possessing its own distinct character and experience, which contributes to a strong sense of place and enhances the residential development. The primary aim of these landscaped spaces is to create culturally balanced, inclusive, and functional environments that provide lasting quality, significance, and relevance within the urban setting.

Harbour sandstone

The elevated sandstone ridge landscapes are integral to Edgecliff and the surrounding areas. The pixelated sandstone stratification, shaped by erosion from coastal winds and streams, creates a textured and patterned landscape characterized by the edges and platforms of the harbour. A stream flows through to Rushcutters Bay.

Geographic location - Water movements through sandstone

Sandstone expression

Vegetated corridors

The quality of the landscape and the layering of vegetation and sandstone that once occupied the site and surrounding area down to the harbour are incorporated into the landscape proposal.

The vegetation communities expressed within the three main landscape spaces as follows:

Elevated Sandstone Plateau and Ridge (Streetscape Edge) Sydney Peppermint, Smooth-barked Apple, Scribbly Gums.

Gullies and ravine (Open Central Courtyard)
Water Gum, Lillypilly Cabbage Tree groves
Shelter Gullies Cyathea australis and Dicksonia antarctica

Ridge Line (Terraces)

Banksia serrata, Banksia integrifolia, Iomandra spec and Grass trees.

Site Context - green corridor

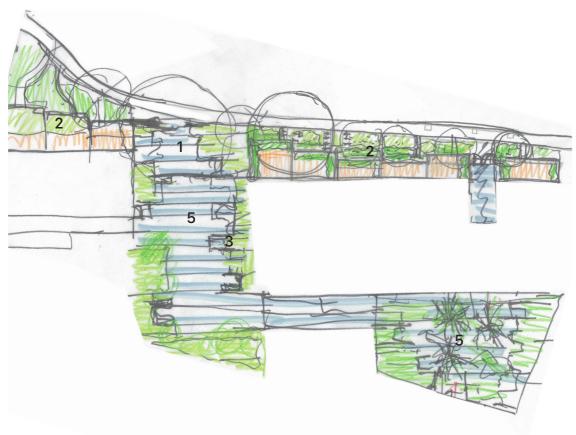

Integrated Landscape

The landscaped areas have been designed to integrate the built environment and public spaces, resulting in culturally inclusive, functional, and enduring landscapes with appropriate amenities.

The following landscapes spaces are carefully integrated into the built form and public domain interface:

- Welcoming entry
- 2. Street frontage Garden apartments
- 3. Linear landscaped elements hard and soft
- 4. Landscaped Courtyards

Landscaped Rooftop - Ecological Corridors

The green roof areas present an opportunity to incorporate a variety of native plants, grasses, and trees, particularly from the eastern suburbs Banksia scrub. This installation demonstrates the effective use of green roofs. Integrating plant life into building designs is essential for addressing the challenges posed by a growing population, climate change, and habitat loss.

Rooftop planting of flowering native vegetation to contribute to biodiversity and pollinating corridors and provide visual landscape

Communal Roof Gardens

The design takes into consideration views, light, sun access, privacy, equitable access and wind mitigation. The objective is to combine the functional amenity of the spaces with a diverse and thriving ecosystem that includes a wide variety of native species, habitats, and ecologies within an urban setting, offering a welcome connection to nature.

Planting Strategy

The planting strategy is to create a cohesive design through the use of carefully selected species that demonstrate a connection to the concept of place making and link to the three landscape community types, Elevated sandstone plateau and ridges, Gullies and ravine, Sandstone Ridge Line The preference is for endemic plants to the Sydney area however the selection will also address the following: Suitable for the existing micro climatic conditions (wind, access to sunlight); Low water use plant species; Maintenance requirements (such as watering regime, fertilising and pruning replacement); Wind breaks to mitigate microclimate conditions; Crime prevention through design; Privacy and screening Selected plants provide visual interest through form, texture and variations in seasonal colour. A diverse planting scheme comprising mass planting of native plant species and a selection of drought tolerant species is proposed for the podium terrace.

The plant palette takes into account the potential impact of wind that may affect the plants at upper levels. The use of diverse shrubs and understory layer in various forms helps creates spaces, achieve accents to the various gardens that are experienced by the tenants and guests.

Sustainability

Sustainability

The intention is that sustainable ecological principles are integrated into the landscape design with the primary focus on water.

Principles such as sustainable Drainage

Systems, a thorough plant selection process and site microclimatic analysis inform the layout, materials selection and environmental response. Initiatives such as rainwater harvesting and reuse, consideration of the extent of embodied energy within landscape materials, durability of material selection and resource requirements of new planting are all considerations and is summarised below:

The primary landscape sustainability initiatives

Water management

- Where possible, stormwater runoff will be collected and treated in local bio-retention systems incorporated into the podium planting zones. Appropriate species and best practise will be utilised in order to locate and design the stormwater treatment areas,
- Capture stormwater runoff and convey treated runoff from the rain gardens.
 Seating elements and raised platforms are options that can be used to mitigate the set downs required to pond and treat the stormwater and to maintain public safety.
- Stormwater is to be harvested and

- retained on site for re-use in the planter bed irrigation system. The garden beds are open to the sky and where possible clear lines of sight are maintained across the public open spaces.
- The integration of green roofs and planted trellises offer water sensitive urban design options to assist in the filtration of stormwater pollutants, improve the thermal performance of the building and attenuate stormwater flows.

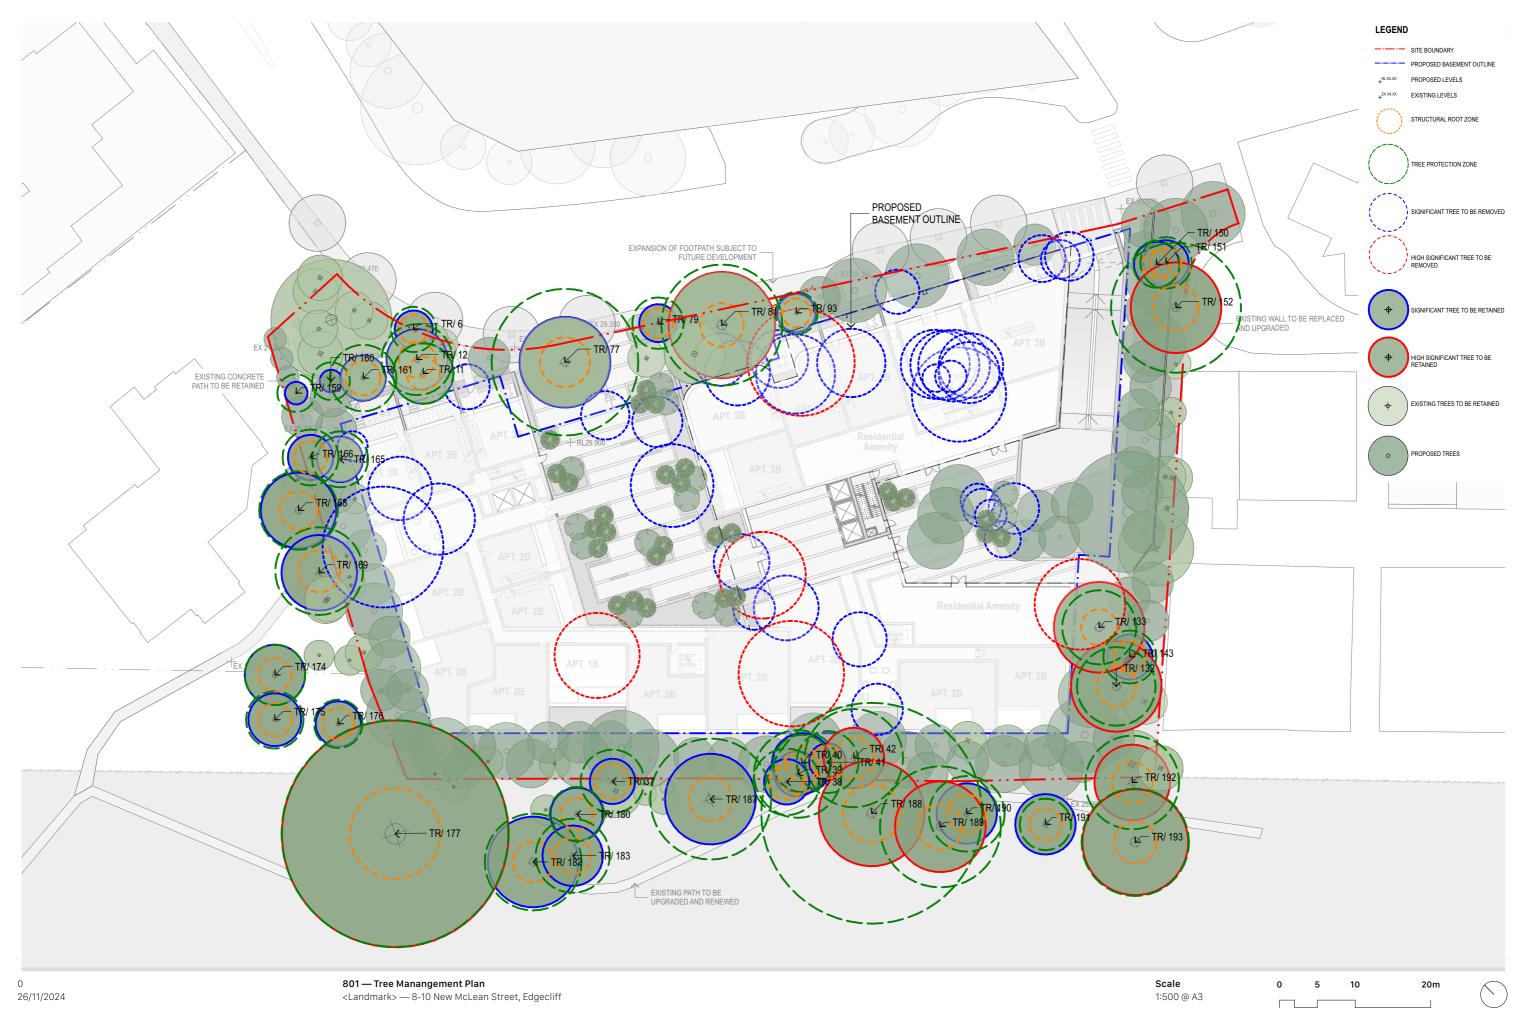

The Landscape materials have been derived from the unique Sydney linear textured contextual landscape
